Subject: **Low Impact Hydropower Institute Recertification Application Supplement for the Holtwood Hydroelectric Project (Certificate #116)**

Dear Ms. Ames:

As a follow up to LIHI's Stage I Recertification Review dated January 13, 2022, BIF III Holtwood LLC (Brookfield) hereby submits a recertification application supplement for the Holtwood Hydroelectric Project (LIHI Certificate #116) in Lancaster County, PA.

Should any additional information be required, please contact me by phone at 570-226-1371, by e-mail at kathleen.lester@brookfieldrenewable.com, or by mail at Brookfield Renewable, 126 Lamberton Lane, Hawley, PA 18428.

Sincerely,

Kathleen E. Lester
Compliance Manager

Page	Comment	Brookfield Response
3	Fish Passage - We would like to get the following information as it becomes available regarding the following: "Brookfield is prepared to complete the third year of radio telemetry studies in 2022, pending discussions with regulatory agencies at the annual FPTAC meetings, currently scheduled for December 7 and 8, 2021. A meeting summary was not finalized by the time of this submittal, nor was a decision made on 2022 fishway operations or Tier II studies." Please submit information on the status of all studies.	The December 2021 fish passage meeting summary is enclosed. As of this date (January 19, 2022), regulatory agencies have not made a decision on 2022 fishway operations or Tier II studies.
3	MSFOP - The 2020 MSFOP Manual annual report was submitted to the FERC and resource agencies on February 1, 2021. The 2021 report was not submitted as of the date of the LIHI application. Please submit the 2021 MSFOP Manual report as it becomes available or a status report on its development.	The December 2021 MSFOP meeting summary and 2021 MSFOP Annual Report are enclosed. The revised MSFOP manual will be completed in late 2022.
4	Please report any flow-related deviations that occurred since submittal of the LIHI application.	There have not been any flow-related deviations that have occurred since the LIHI application was submitted on December 10, 2021.
4	Please provide the 2021 dissolved oxygen (DO) report when it is available.	The 2021 Dissolved Oxygen Monitoring Report is enclosed.
5	The 2021 MSFOP Manual annual report for 2021 report was not submitted as of the date of this submittal. Brookfield should submit the 2021 MSFOP Manual report as it becomes available or a status report on its development. Brookfield is prepared to complete the third year of radio telemetry studies in 2022, pending discussions with regulatory agencies at the annual FPTAC meetings, currently scheduled for December 7 and 8, 2021. Also, a meeting summary was not finalized by the time of this submittal, nor was a decision made on 2022 fishway operations or Tier II studies. Please provide a status update.	The December 2021 MSFOP meeting summary and 2021 MSFOP Annual Report are enclosed. The revised MSFOP manual will be completed in late 2022. The December 2021 fish passage meeting summary is enclosed. As of this date (January 19, 2022), regulatory agencies have not made a decision on 2022 fishway operations or Tier II studies.

Damian Gomez (Gomez & Sullivan)

DATE: December 8, 2021 at 12:30 p.m.

In December 2021, meetings were combined and held remotely due to COVID-19. On December 7th, agencies, consultants and licensees all came together to see presentations on fish passage numbers for 2021 as well as any studies that were occurring on the river system. Approximately 45 people attended.

An overall discussion was held regarding the future of invasive species management on the river system. Both Brookfield and Exelon asked agencies what their management plans were and expressed concern over the annually requested changes to the lift operations and how that affects our permits, licenses, and study plans. The agencies were unable to provide any direction for the future but confirmed that they are discussing regularly and will update us when possible and/or solicit feedback.

On December 8th, Brookfield met with resource agencies to discuss fish passage operations specifically at Holtwood and Safe Harbor.

2021 HOLTWOOD FISH PASSAGE

Based on a call with agencies on October 20, 2020, Brookfield submitted a request on November 17, 2020 to suspend 2021 spring and fall fish passage as well as the Tier II radio telemetry study due to concerns with the spread of invasive species. PADEP and USFWS sent letters of support in December 2020.

Brookfield filed a request with FERC on January 5, 2021 for the suspension of fish passage and Tier II study, which was approved on February 26, 2021. The variance was approved but noted that if Brookfield or resource agencies determine that permanent modifications are needed to reduce the spread of invasive species, a request for amendment will be required to be submitted to the FERC prior to the 2022 spring fish passage season.

2021 FISH LIFT REPAIR & MAINTENANCE

The following maintenance and repairs were completed in 2021 at the Holtwood fish lift:

- Pre-season maintenance completed.
- Ongoing hopper hoist maintenance including wheel alignment and greasing.
- Re-engineered MOV4's actuator to give better flow control within the lift. All upgrades completed and tested in 2021.
- MOV5's new actuator was installed. The new actuator is significantly larger and required modifications. Electrical upgrades to support the load of the new actuator were completed.
- During flow testing, B entrance gate became stuck open, well below the water surface and will require divers to investigate.

CFD MODELING

In 2020, Gomez & Sullivan performed a field test to determine if the current automatic settings for the flow distribution valve matrix produced the recommended flow velocities within the lifts. Eddying and upwelling was observed.

In 2021, they evaluated alternative flow distributions and CFD models were developed for each lift and used to model hydraulics for different tailwater conditions.

The draft report was received on 12/6/21 so only a high-level update was provided at the meeting. The highlights are:

- Current automatic settings are intended to result in a drop through the entrance gates of 1 ft, which appears to result in overly turbulent flow at the entrances.
- Current automatic settings do not produce the proper flow through the lift.
- Analyses indicate that flow conditions at the entrances would be improved by reducing the drop at the entrances to 0.5 ft, which will result in less turbulence where the attraction flow enters the downstream channel.

- The CFD models and observations during the site visit indicate that increasing the proportion of flow introduced upstream of the hoppers would improve overall flow conditions.
- Tailrace crowder velocity will need to be ~3ft/s to eliminate eddies at the A/B entrance split.
- It was found that there is significant upwelling which occurs in the spillway crowder during automatic matrix operations with the old and new settings.

Brookfield will review the report fully. In 2022, we plan to investigate the cause of the spillway attraction flow upwelling in the crowder area, permanently update the valve operating matrix, evaluate lift frequency due to higher flows within the tailrace lift, and evaluate operating either A or B entrance gate independently.

Once the operating matrix is updated to align with the new settings, the Fishways Operating Plan will be updated. Brookfield considers these changes to be operational changes. Per the approved study plan, if operational modifications are implemented, only the results from those years following the operational modifications shall be considered to determine whether the 85% passage percentage is achieved.

Jesus Morales of USFWS noted his appreciation for the work and supports the analysis. He noted a possible concern with increasing the velocity at the tailrace crowder from 1.5 ft/s to 3 ft/s and the possibility of fish exerting too much energy. Jesus Morales mentioned a 1 ft head differential is "too aggressive" considering the entrance gate floor diffusers being right at the gate. Dustin recognized the concern and noted that increasing the lift frequency or using only A or B entrance gate may alleviate that.

INVASIVES

In 2020, PADEP recommended that Brookfield evaluate the ability and/or mechanisms to manage invasive species in preparation for the 2022 fish passage season. Brookfield conducted a site visit to the Conowingo East Fish Lift (EFL), West Fish Lift (WFL), in May of 2021 to see how their lifts operate, and how they are sorting invasives. The sorting process was found to be a manual and labor intensive task detracting attention from anadromous fish.

Holtwood and Safe Harbor lifts are not designed the same as Conowingo and have no safe or viable method for fish removal/sorting. The lifts are designed to volitionally pass fish, not exclude them.

Since there is currently no scope or agency guidance on invasives management, and there is no regulatory requirement to manage them, Brookfield has not looked into this further. There are concerns with how these annual changes affect our FERC licensing requirements. Brookfield will reach out to FERC to update them on current operations.

USFWS noted Conowingo is more conducive to invasive removals and that Holtwood currently has no requirement in place for invasives. It is a continually discussed topic with no resolution yet. They are taking it one year at a time.

2022 FISH PASSAGE

Brookfield is prepared to operate their lifts in 2022 but is waiting for direction from the agencies. Agencies noted they hope to have a request to us shortly. Brookfield plans to investigate and fix entrance gate B, investigate the upwelling, and adjust the operating matrix.

It is Brookfield's understanding that Exelon will be trap and trucking 80% of fish caught at the Conowingo Dam and moving them up above York Haven. The other 20% is in question right now for where they will be put, which puts Holtwood's Tier II study in question.

Before the meeting, USFWS, PFBC and PADEP informally requested the idea of a study involving the placement of a small sample size of tagged and trucked fish into the Holtwood fish lift, with the entrance and exit screened to contain the fish. The lift would be operated to see their behavior inside of it and they would then need to be captured and not allowed to pass. Brookfield has many concerns with this type of study including the logistics, safety, and the validity of the data. Brookfield voluntarily conducted a historical research study, flow study, and CFD modeling. We are committed to improving the lift but do not believe this study adds value to it. It is also not an approved study.

The agencies noted that they are still considering having the 20% put into Conowingo Pond and asked if Brookfield could conduct their Tier II radio telemetry study if the fish were trucked up into Conowingo Pond but stocked below Normanwood Bridge. Brookfield will review the approved study plan.

FUTURE FALL FISH PASSAGE OPERATION

On August 12, 2019, PADEP committed to follow up on fall fish passage by reviewing all of the data after the 2019 season. In 2020 and 2021, PADEP requested the Brookfield suspend fall fish passage due to the possible spread of invasive species.

Long term, Brookfield would like our earlier request to discontinue fall fish passage kept as an open action item.

ROUNDTABLE COMMENTS

Sheila Eyler asked for a status on Holtwood's upcoming LIHI recertification. Katie Lester noted that the current certification is due to expire on January 20, 2022 and that Brookfield plans to file the application shortly.

The meeting adjourned at 1:35 p.m.

HOLTWOOD MINIMUM STREAM FLOW OPERATION PLAN
2021 ANNUAL MEETING
JANUARY 5, 2022
(MEETING HELD BY TEAMS)

Attendees:
Cale Benard (Brookfield Renewable)
Dustin Droege (Brookfield Renewable)
Katie Lester (Brookfield Renewable)
Jon Rhoads (Brookfield Renewable)
Adam Slowik (Brookfield Renewable)
John Balay (SRBC)
Ron Eberts (PA DEP)
Jeremy Miller (PA DEP)
Sheila Eyler (USFWS)
Rick McCorkle (USFWS)
Shawn Seaman (MD DNR)
Josh Tryninewski (PFBC)
Andrea Danucalov (Exelon)

Katie Lester, Compliance Manager for Brookfield, welcomed everyone to the annual Minimum Stream Flow Operating Plan (MSFOP) meeting at 9:30 a.m. The meeting was again held remotely this year. The purpose of the meeting is to review the previous year's performance with MSFOP at the Holtwood Project.

The Holtwood MSFOP sets forth how Brookfield will achieve and monitor the implementation of the minimum stream flows at the Project from Lake Aldred including (1) Piney Channel (2) the Tailrace and (3) the Spillway Area. The minimum flow regime for the Project is complex due to the size and configuration of the project, as well as the varying needs for water below the project.

REGULATORY REQUIREMENTS

Regulatory requirements and agreements include: the PA DEP 401 Water Quality Certification issued June 15, 2009, the FERC order Modifying MSFOP pursuant to Article 51 issued April 19, 2012, the SRBC Approval issued June 18, 2009, and the 2009 Exelon Generation and Holtwood Settlement Agreement.

SPECIFIC FLOW AGREEMENTS

Specific flow Agreements that the MSFOP addresses include the following:

1. Implementation of the QFERC daily volumetric flow release (including leakage) equal to the lesser of net inflow or 98.7 percent of the Conowingo project's minimum flow obligation.
2. A continuous minimum flow from the Project of 800 cfs or net inflow, if less.
3. Initiation of a 200 cfs continuous conservation release to Piney Channel.
4. Continuation of a continuous minimum stream flow to the spillway area below the dam at least equivalent to the present rate of leakage through the dam flashboards plus the present rate of flow through the 10-inch pipe in the dam.

5. The initiation of periodic wetting flow to the spillway area, following the end of anadromous fish passage operation, during June through September whenever river flow exceeds 31,000 cfs and is less than 61,500 cfs.

Brookfield discussed the new changes to MSFOP as a result of Exelon's new FERC license being issued in March of 2021 for the Conowingo project. Three changes took effect immediately including the dates in June, the QFERC amount from Dec 1 to Feb 28 and the continuous min flow for Dec 1 to Feb 28. Brookfield committed to updating the MSFOP Plan and Manual in 2022.

They also reviewed the more extensive minimum flow changes coming in 2024 as a result of the same FERC license changes downstream. This will require more research and coordination with PJM.

All of the various options that Brookfield has to meet these obligations were reviewed.

Several aerial photos were presented to depict the different areas that flow needs to be released downstream of the Project. An overview of the Piney weir was also provided. The gates are open during fish passage season but closed during the growing season for plants. Photos of the Obermeyer gates were shown and it was reported that there were no issues with them in 2021.

MSFOP COMPLIANCE

The daily MSFOP operator data sheets were designed to assist the Holtwood operators to manage outflows to meet the various flow requirements of the Project's FERC license. The spreadsheet includes color-coded operator alerts and recommended actions to impending minimum flow issues. The MFSOP spreadsheet computes, records, and provides a daily report that summarizes minimum stream flows at the project. Any issues are elevated to the Operations Supervisor. As a reminder, the MSFOP daily clock runs from 0300-0300 so that the operator has time to make up any required flows.

Per the MSFOP plan, any continuous MSFOP deviations are reported to FERC and resource agencies within 10 Days.

The annual MSFOP report was sent to the PA DEP, as well as other Resource Agencies (PFBC, PA DCNR, SRBC, MD DNR, USFWS, and USACOE), and Exelon on December 22, 2021 and included 12 monthly summary documents. The final report will be due to FERC by March 1, 2022.

Brookfield notified agencies that the Holtwood plant is working on a project to automate the plant so that it will be operated by Brookfield's National System Control Center (NSCC). The plant would still have an operator on-site, but they would not be staffing the control room 24/7. The goal is to have it operational by late spring 2022. The upgraded controls system will allow for better alarming for the NSCC and local operator to ensure we are meeting the MSFOP requirements. At this time, we are not planning to modify the layout of the annual report.

MSFOP DEVIATIONS

The reporting period covers the time period of December 16, 2020 to December 15, 2021. There was no continuous minimum flow deviation during this time period.

SPILLWAY IRRIGATION FLOWS FOR T&E PLANTS

When river flows are between 31,000 and 61,500 cfs, Brookfield is required to release 1,000 cfs for one hour to irrigate two identified plants in the spillway – White Doll's Daisy and Sticky Goldenrod. DCNR

recommended that we monitor the species for 5 years after construction to determine if flows are effective to preserving the population. There is a potential for up to 15 years of monitoring.

The annual plant surveys began in 2014. After reviewing the five years of data, DCNR recommended continuing annual surveys of the White Doll's Daisy for 3 more years and monitor the Sticky Goldenrod every 3 years (next in 2022). In spring 2023, Brookfield will request a meeting with DCNR to again review the data and discuss the future of monitoring.

Irrigation flows to the spillway area for endangered plant species was required in 2021. River flows ranged from 9,980 (July 1) to 258,000 (September 2) following migratory fish passage season (June 1 through September 30). A chart depicting river flows during this time period was shown.

While not considered a continuous minimum flow, there was one instance where the spillway watering commitment was not fully satisfied on September 10, 11, 12 and 13. Due to high flows during Hurricane Ida, Holtwood lost flashboards and was unable to maintain summer recreation pool level. Because of this, we could not make our commitment to periodic plant watering flows. A lake drawdown was performed to repair the flashboards and once back in place, our commitments were all met. Agencies were notified on September 14, 2021. In the future, the water level will be brought up for short period to spill required amount and meet all of our obligations.

WHITEWATER OPERATION

Each year, Brookfield commits to providing 264 hours of whitewater hours to the boating group. In 2021, 264 hours were offered. No makeup hours from 2020 needed to be achieved. If fish passage does not occur in 2022, Brookfield intends to offer whitewater hours and is working on a schedule to not impact fisherman in the mornings.

The annual meeting with whitewater stakeholders will be held in February 2022.

OTHER COMMENTS

Jeremy Miller of PADEP asked when the automation project should be completed. Brookfield indicated that it should finish in late spring 2022.

Jeremy Miller asked if the white water feature has a website and if inspections are completed of the facility. Brookfield indicated that the schedule is posted on the safewaters website and that inspections are done throughout the year to look at the structure and any debris accumulation that has occurred.

Richard McCorkle of USFWS asked if there is any consideration being given to replacing the flashboards with Obermeyer gates. Dustin Droege noted that it is periodically investigated and that all facets of the project are looked at including the costs, crew safety, downtime during installation, etc.

Shelia Eyler of USFWS asked if there is potential for negative energy pricing to impact minimum flow obligations. Dustin Droege noted that Unit 1 remains online regardless because it feeds Piney Channel. If required, an Obermeyer gate could be lowered to also achieve flows.

John Balay of SRBC thanked the group for the meeting and appreciated having the new minimum flow changes explained.

As required, Brookfield plans to submit a copy of the annual MSFOP Report to FERC prior to March 1, 2022.

The meeting adjourned at approximately 10:00 AM.

VIA EMAIL

December 22, 2021

Mr. Scott R. Williamson, Program Manager
Department of Environmental Protection; Waterways and Wetlands Program
South Central Regional Office
909 Elmerton Ave.
Harrisburg, PA 17110

RE: HOLTWOOD HYDROELECTRIC PROJECT FERC NO. 1881-054
2021 ANNUAL MINIMUM FLOW REPORT
PA DEP 401 WATER QUALITY CERTIFICATE

Dear Mr. Williamson:

In compliance with Condition number IV A of the Pennsylvania Department of Environmental Protection ("PA DEP") 401 Water Quality Certificate ("WQC") issued June 15, 2009 and the Federal Energy Regulatory Commission ("FERC") Order Modifying and Approving Minimum Stream Flow Operations Procedures Manual Pursuant to Article 51 issued April 19, 2012, BIF III Holtwood, LLC ("Brookfield") is submitting its 2021 Annual Minimum Flow Report for the Holtwood Hydroelectric Project.

The WQC requires Brookfield to submit an annual report by December 31 of each year and meet with the resource agencies by January 31 of each year to discuss any changes to the minimum flow operating procedures. Brookfield is hereby submitting the 2021 Annual Report to the PA DEP, as well as other Resource Agencies (PFBC, PA DCNR, SRBC, MD DNR, USFWS, and USACOE), and Exelon, for review and comment. This report covers the time period of December 16, 2020 to December 15, 2021.

The Holtwood Minimum Stream Flow Operations and Implementation Plan ("Plan") sets forth how Brookfield will achieve and monitor the implementation of the minimum stream flows at the Project from Lake Aldred including (1) Piney Channel (2) the Tailrace and (3) the spillway area. The minimum flow regime for the Project is complex due to the size and configuration of the project, as well as the varying needs for water below the project. In addition to the FERC license and the 401 certification, minimum flow releases are also authorized by the Susquehanna River Basin Commission ("SRBC") and directed as part of the 2008 settlement agreement with Exelon Generation Company, LLC ("Exelon").

Specific flow requirements that the Plan addresses include the following:

1. Implementation of the QFERC daily volumetric flow release (including leakage) equal to the lesser of net inflow or 98.7 percent of the Conowingo project's minimum flow obligation[1].
2. A continuous minimum flow from the Project of 800 cfs[2] or net inflow, if less.
3. A continuous 200 cfs continuous conservation release to Piney Channel.
4. Continuation of a continuous minimum stream flow to the spillway area below the dam at least equivalent to the present rate of leakage through the dam flashboards plus the present rate of flow through the 10-inch pipe in the dam.

BIF III Holtwood LLC
482 Old Holtwood Road
Holtwood, PA 17532
www.brookfieldrenewable.com
Tel: 717.284.6260
Fax: 717.284.6234

Brookfield
Renewable U.S.

5. The initiation of a periodic wetting flow to the spillway area during June through September whenever river flow exceeds 31,000 cfs and is less than 61,500 cfs.

[1] If the minimum flow at Conowingo Dam changes in the future, the daily minimum flow from the Holtwood Project will be adjusted accordingly.
[2] If Conowingo's minimum flow requirements are ever modified then the 800 cfs Continuous Minimum Flow shall be adjusted by an equivalent percentage.

Per the WQC, the FERC Order Modifying and Approving Minimum Stream Flow Operations Procedures Manual, and the Plan, the Holtwood Project provided a daily volumetric flow release equal to the lesser of net inflow or 98.7 percent of the Conowingo project's minimum flow obligation. In addition, the Project routinely maintained a continuous release of 800 cfs or net inflow, if less and a 200 cfs continuous release into Piney Channel.

On March 19, 2021, Exelon was issued a new license by the FERC for the downstream Conowingo Dam (P-405) which laid out modified minimum flows. We immediately contacted Exelon to verify the flows that were changing in 2021 and then contacted PADEP for clarification. Changes that took place in 2021 were the increase for June 1 to June 15 from 5,000 cfs to 7,500 cfs and from December to February, the flow changed from 1,750 cfs to 3,500 cfs. Brookfield implemented these changes and discussed other upcoming changes with PADEP, including the update of the MSFOP Plan and Manual, which will be done in 2022.

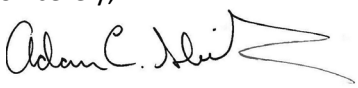

Per the FERC Order Approving the MSFOP, the licensee is required to report any deviations from the required continuous minimum flows or the daily average minimum flow. There were no minimum flow deviations in 2021.

While not considered a continuous minimum flow, there was one instance where the spillway watering commitment was not fully satisfied on September 10, 11, 12 and 13. When flows are between 31,000 and 61,500 cfs from June to September, we are required to release 1,000 cfs for one hour to irrigate the spillway plants. Due to high flows during Hurricane Ida, Holtwood lost flashboards and was unable to maintain summer recreation pool level. Because of this, we could not make our commitment to periodic plant watering flows. A lake drawdown was performed to repair the flashboards and once back in place, our commitments were all met. Agencies were notified on September 14, 2021.

Please review and let us know if you have any comments. Brookfield intends to file this report with FERC by March 1, 2022 as required.

Should any additional information be required, please contact me by phone at 215-620-4589, by e-mail at adam.slowik@brookfieldrenewable.com, or by mail at Brookfield Renewable, 482 Old Holtwood Rd, Holtwood, PA 17532.

Sincerely,

Adam Slowik

RE: Holtwood Hydroelectric Project – FERC No. 1881-067
2021 Annual Dissolved Oxygen Monitoring Program Report

Dear Secretary Bose:

BIF III Holtwood LLC (Brookfield) hereby submits the 2021 Dissolved Oxygen Monitoring Program Report for the Holtwood Hydroelectric Project as required by the Dissolved Oxygen Monitoring Plan approved by the Federal Energy Regulatory Commission (FERC) on January 19, 2011.

Per the approved Dissolved Oxygen Monitoring Plan, the monitoring season is from April 1 to September 30. During the season, the adjusted dissolved oxygen values at the Holtwood project met the Pennsylvania Water Quality Standards for the 7-day average (7-day average of 5.5 mg/L) at the Piney Channel, Forebay and Tailrace locations throughout the 2021 season. There were low adjusted instantaneous readings below the state standard (minimum 5.0 mg/L instantaneous) in the Forebay, Piney Channel and Tailrace. The low adjusted dissolved oxygen readings occurred periodically from mid-June to mid-August during low river flows. Details can be found in the enclosed report, as well as in all deviation reports previously filed with the FERC.

The dissolved oxygen deviation report filed on July 26, 2021 inadvertently did not include the few low adjusted instantaneous dissolved oxygen readings below the state standard that occurred on July 3 and 4 in the Piney Channel. The low readings occurred at the same time as the low instantaneous readings in the forebay and tailrace that were reported in the July 26 report. Dissolved oxygen readings from the Piney Channel can be found in Appendix D of the enclosed report. The low readings are found highlighted in red.

The Dissolved Oxygen Monitoring Plan required that dissolved oxygen be monitored for five years. At the request of Pennsylvania Department of Environmental Protection (PADEP), Brookfield conducted an extra two years of monitoring, which was completed this 2021 season. Brookfield will now request a meeting with PADEP to review the data and discuss the future of dissolved oxygen monitoring at the Holtwood project.

Executive Summary

The Federal Energy Regulatory Commission (FERC) issued a license amendment, dated October 30, 2009, for the Holtwood Hydroelectric Project (Holtwood). This license amendment approved the Dissolved Oxygen Monitoring Plan to Article 53 and Section 401 of the Water Quality Certificate. This plan describes how Holtwood will monitor dissolved oxygen (DO) after redevelopment was completed.

Three monitoring locations were selected to continuously monitor DO concentration and river temperature every 30 minutes from April 1 through September 30 for five years following the start of operations of the new power station. This monitoring was checked against the current Pennsylvania Water Quality Standards for DO (minimum of 5.0 mg/L instantaneous, along with a 7-day average of 5.5 mg/L). This report describes the DO monitoring in 2021, and the seventh year of monitoring.

Objectives of 2021 DO monitoring were to (1) monitor and maximize the number of DO and temperature data values at the three monitoring locations and (2) minimize interruptions of data values at the three monitoring locations due to equipment breakdowns or malfunctions.

The three monitoring stations (Forebay, Piney Channel, and Tailrace) were in the same locations as in the six previous monitoring years. Onset HOBO DO loggers (U26-001) were exclusively used to monitor DO and water temperature at 30 minute intervals. Lab calibrations using the HOBOware program were conducted with the three monitors prior to deployment on April 1. Additional lab calibrations were performed on-site with a laptop computer on June 23 and August 17 for the Forebay and Tailrace monitors and on June 23 and August 24 for the Piney Channel monitor. Calibration checks and maintenance of the DO loggers were conducted weekly and followed manufacturer's specifications.

Daily river flows in 2021, as measured at the USGS Marietta, PA Gage (USGS No. 01576000) ranged from a low of 9,980 cfs on July 1 to a high of 258,000 cfs on September 2. River flows were near or below the mean daily values during the first month of the monitoring period, then they fluctuated both above and below the daily mean values for the next two months. The last three months of the monitoring period the river flows were above the mean daily values.

Adjusted DO values were calculated by using the HOBOware Dissolved Oxygen Assistant program to obtain accurate dissolved oxygen readings by entering the calibrated hand held meter's start and end field calibration readings with the corresponding date and time as the DO logger's readings. The field calibration readings are used to compensate for measurement drift due to biofouling on and around the sensor cap of the DO logger.

A total of 8,538 adjusted DO values were calculated from the Forebay monitoring station. Adjusted DO values ranged from a low of 2.94 mg/L on August 17 to a high of 12.74 mg/L on May 20. The average adjusted DO values for the six month monitoring period was 8.48 mg/L. Of these adjusted data values, a total of 92 (0.53%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from mid-June to mid-August during low river flow period. A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 5.73 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was

12.01 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Forebay monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

A total of 8,529 adjusted DO values were calculated from the Piney Channel monitoring station. Adjusted DO values ranged from a low of 4.70 mg/L on July 4 to a high of 12.97 mg/L on April 28. The average adjusted DO values for the six month monitoring period was 8.75 mg/L. Of these adjusted data values, a total of 27 (0.15%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from mid-June to July 4 during low river flow period. A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 6.02 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was 12.02 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Piney Channel monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

A total of 8,519 adjusted DO values were calculated from the Tailrace monitoring station. Adjusted DO values ranged from a low of 0.93 mg/L on June 19 to a high of 12.51 mg/L on May 20. The average adjusted DO values for the six month monitoring period was 8.40 mg/L. Of these adjusted data values, a total of 91 (0.52%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from June 11 to mid-July during low river flow period. A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 5.57 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was 11.92 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Tailrace monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

The water quality monitoring season at the Holtwood project in 2021 was successful with one interruption of the data due to the monitor recording data that exceeded the maximum allowable limit of >±2.0 mg/L or 20%, whichever is greater at both the Forebay and Piney Channel locations. Another data gap was due to being removed because of high river flow (>100 kcfs) at both the Forebay and Piney Channel monitors in September. The Tailrace location had two interruptions of data due to the monitor being vandalized (removed from the tailrace water). The lab calibrations in June and August attributed to the remaining data gaps.

The Forebay location had a total of 92 (0.53%) adjusted DO values that were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. Even though there were low instantaneous DO values at the Forebay, all of the adjusted rolling 7-day average DO values met the Pennsylvania state standard of 5.50 mg/L. The Piney Channel location had a total of 27 (0.15%) adjusted DO values that were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. Even with the low instantaneous DO values at the Piney Channel, all of the adjusted rolling 7-day average DO values met the Pennsylvania State standard of 5.50 mg/L throughout the monitoring period. At the Tailrace location, a total of 91 (0.52%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. Even with the low instantaneous DO values at the Tailrace, all of the adjusted rolling 7-day average DO values met the Pennsylvania State standard of 5.50 mg/L.

1.0 Introduction

The Federal Energy Regulatory Commission (FERC) issued a license amendment, dated October 30, 2009, for the Holtwood Hydroelectric Project (Holtwood) located on the Susquehanna River in Lancaster County, Pennsylvania. The Holtwood license amendment approved the Dissolved Oxygen Monitoring Plan (Kleinschmidt, 2010) pursuant to license Article 53 and Section 401 of the Water Quality Certificate. This plan describes how Holtwood will monitor dissolved oxygen (DO) after redevelopment was completed.

Three monitoring locations were selected to continuously monitor DO concentration and river temperature every 30 minutes from April 1 through September 30 for five years following the start of operations of the new power station. This monitoring was checked against the current Pennsylvania Water Quality Standards for DO (minimum of 5.0 mg/L instantaneous, along with a 7-day average of 5.5 mg/L). This report describes the DO monitoring in 2021, and the seventh year of monitoring.

Objectives of 2021 DO monitoring were to (1) monitor and maximize the number of DO and temperature data values at the three monitoring locations and (2) minimize interruptions of data values at the three monitoring locations due to equipment breakdowns or malfunctions.

2.0 Holtwood Operation

2.1 Project Operation

Holtwood, built in 1910, is situated on the Susquehanna River (river mile 24) in Lancaster and York counties, Pennsylvania (Figure 1). It is the second upstream hydroelectric facility on the river. The project now consists of a concrete gravity overflow dam 2,392 ft. long by 55 ft. high, the legacy powerhouse with ten turbine units having a combined generating capacity of 107 MW, the new powerhouse containing 2 large Kaplan turbines (100 MW capacity) and a reservoir (Lake Aldred) of 2,400 acres surface area. Each legacy unit is capable of passing approximately 3,000 cfs with each Kaplan turbine passing approximately 15,000 cfs. Spills occur at the project when river flow or project inflow exceeds the station hydraulic capacity of approximately 62,000 cfs.

Hydraulic conditions in the Holtwood spillway are controlled by numerous factors that change hourly, daily and throughout the project operating season. The primary factors are natural river flows, operation of the power station, operation of the Obermeyer gates controlling flow into Piney Channel, and operation of the upstream Safe Harbor Hydroelectric Project.

3.0 Methods

3.1 Water Quality Monitoring Stations

The three monitoring stations (Forebay, Piney Channel, and Tailrace) were in the same locations as in the six previous monitoring years (Figure 2). Onset HOBO DO loggers (U26-001) were exclusively

used to monitor DO and water temperature at 30 minute intervals. Calibration checks and maintenance of the DO loggers was conducted weekly and followed manufacturer's specifications.

All three DO Loggers were lab calibrated using 100-percent water saturated air and a zero DO solution (sodium sulfite) in the HOBOware Pro software following the lab calibration tool steps (Appendix A). Lab calibration typically remains accurate for the full 6-month life of the sensor cap if there is little to no fouling. Once the DO Logger's lab calibrations were completed, the logging interval of 30-minutes was established and the DO loggers were launched and ready for deployment. Additional lab calibrations were performed on-site with a laptop computer on June 23 and August 17 for the Forebay and Tailrace monitors and on June 23 and August 24 for the Piney Channel monitor.

During the initial deployment at the three monitoring stations, the DO loggers were placed in the river and allowed to acclimate for approximately 30 minutes prior to recording field calibration readings. The weekly field calibration checks for dissolved oxygen are recorded using a calibrated HACH MS5 Sonde and Surveyor. This HACH MS5 Sonde is calibrated in the morning prior to arriving at Holtwood.

Weekly field calibration checks consist of arriving at each of the monitor locations and inspecting for damage or vandalism. The HACH MS5 Sonde is placed in the river near the DO logger and a field calibration check reading is recorded on the data sheet (Appendix B) at one of the 30 minute intervals (on the hour or 30-minutes after the hour). After allowing the DO logger to record its DO value, the logger is pulled out of the river. The logger is removed from a protective PVC housing so the logger's data can be downloaded to a HOBO Waterproof Shuttle (U-DTW-1). Once the data has been downloaded from the DO logger, the anti-fouling guard is removed and the sensor cap is gently cleaned with a soft bristle brush to remove biofouling. When finished cleaning the sensor cap and anti-fouling guard, the guard is re-installed on the DO logger. After the DO logger has been downloaded, the shuttle will re-launch the DO logger and a new deployment period will begin. The cleaned DO logger is then placed back in the PVC housing and re-deployed in the river. At the next 30-minute interval another field calibration reading is recorded on the data sheet with the Surveyor and HACH MS5 Sonde to start the next monitoring period. The next field calibration reading recorded the following week will be the end point for that monitoring period.

After the three locations have been downloaded to the shuttle, the data was then offloaded to the HOBOware Pro software and saved on a computer. The three individual files (Forebay, Piney Channel, and Tailrace) are opened one at a time and the HOBOware Dissolved Oxygen Assistant program is used to obtain accurate dissolved oxygen readings by entering the HACH MS5 Sonde start and end field calibration readings with the corresponding date and time as the DO logger's readings. The field calibration readings are used to compensate for measurement drift due to biofouling on and around the sensor cap of the DO logger. All calibration checks and data corrections due to fouling and calibration drift were completed following the HOBOWare Pro software steps and per manufacturer guidelines. An accuracy rating for each HOBOware adjusted DO values compared to the raw (recorded) DO value are based on one of four classifications ranging from excellent to poor (Wagner *et. al.* 2006). Excellent is ≤±0.3 mg/L or ≤±5%, whichever is greater; Good is >±0.3-0.5 mg/L or >±5-10 %, whichever is greater; Fair is >±0.5-0.8 mg/L or >±10-15%, whichever is greater; and Poor is >±0.8 mg/L or >±15%, whichever is greater. If the HOBOware adjusted DO value is greater than 2.0 mg/L or 20%, whichever is greater, from the raw (recorded)

DO value it then exceeds the "maximum allowable limit" and the corresponding adjusted DO value(s) will not be part of the reported database.

3.1.1 Forebay Station

The Forebay station was located on the downstream side of the skimmer wall and the DO logger was secured in a protective PVC canister and deployed at approximately mid-depth in the water column via a stainless steel cable attached to the skimmer wall railing. Weight was added to the terminal end of the cable to ensure the DO logger is suspended near mid-depth in the water column.

3.1.2 Piney Channel Station

The Piney Channel station was located near the gate of the walkway to Piney Island. The DO logger was secured in a protective PVC canister and positioned downstream of the Unit 1 discharge. It was suspended via a stainless steel cable from the yellow hand rail of the walkway. Weight was added to the terminal end of the cable which rested on the bottom to keep the monitor from moving around and contacting the wall under higher flows.

3.1.3 Tailrace Station

The Tailrace station was located at the lower end of the Fishermen's Platform. The DO logger was secured in a protective PVC canister and attached to a railroad tie plate to keep the DO logger from being damaged during increased flow events. A stainless steel cable attached the railroad plate to the railing on the platform and the cable was secured with a padlock to deter vandalism.

4.0 Results

4.1 River Flow

The river flow in 2021, as measured at the USGS Marietta, PA Gage (USGS No. 01576000) located approximately 22 miles upstream of Holtwood, was recorded on the data sheets and is provided in Figure 3. Daily river flows ranged from a low of 9,980 cfs on July 1 to a high of 258,000 cfs on September 2 (USGS website). River flows were near or below the mean daily values during the first month of the monitoring period, then they fluctuated both above and below the daily mean values for the next two months. The last three months of the monitoring period the river flows were above the mean daily values (Figure 3). The minimum mean daily river flow occurred on July 1 at 10,300 cfs and the maximum mean daily river flow peaked at 212,000 cfs on September 2 (Table 1). Three river flow events occurred that were near or greater than 100 kcfs in 2021. Figure 4 provides the hourly river flow as recorded at Holtwood. Daily river flow from the average hourly flow recorded at Holtwood is provided in Table 2. Flow in Piney Channel was maintained by Unit #1 during the monitoring season except for four short periods on June 2 from 1200 to 1300 hour; August 11 from 0800 to 0900 hour; August 12 from 0900 to 1100 hour; and August 25 from 1500 to 1600 hour when it was not operating. During these time periods, flow in Piney Channel was maintained by partially opening Obermeyer Gate #1 to uphold the minimum flow requirement in Piney Channel.

4.2 Forebay Temperature and Dissolved Oxygen

A total of 8,538 water temperature values were recorded from the Forebay monitoring station (Table 3). Water temperatures varied each month during the six month monitoring period. Water temperature ranged from a low of 8.30°C (46.94°F) on April 4 to a high of 29.44°C (84.99°F) on August 13. The average water temperature during the six month monitoring period was 21.67°C (71.01°F).

During 2021, two DO data gaps occurred at the Forebay Station. One was due to the monitor recording data that exceeded the maximum allowable limit of >±2.0 mg/L or 20%, whichever is greater. This data gap occurred on June 29 at 0530 hour to 1000 hour. The other data gap was due to being removed because of high river flow (>100 kcfs) and occurred from September 2 at 1135 hour until September 7 at 0816 hour. Two Lab calibrations of the Forebay HOBO monitor were completed during the monitoring period and occurred on June 23 from 0831 to 0938 hour and on August 17 from 0931 to 1021 hour.

A total of 8,538 DO raw data values were collected from the Forebay monitoring station (Table 3 and Appendix C). Raw data DO values ranged from a low of 2.62 mg/L on August 17 to a high of 12.77 mg/L on April 25. The average raw data DO values for the six month monitoring period was 8.47 mg/L. Of these raw data DO values, a total of 131 (0.75%) raw DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low raw DO values occurred periodically from mid-June to mid-August.

A total of 179 raw daily average DO values were calculated during the monitoring period. The minimum and maximum raw daily DO values were 4.85 mg/L on July 4 and 12.57 mg/L on April 25, respectively. The average of the raw daily DO values for the entire monitoring period was 8.45 mg/L.

A total of 177 raw DO data rolling 7-day average values were calculated for the monitoring period. The minimum raw DO data rolling 7-day average was 5.71 mg/L and occurred from June 30-July 6. The maximum raw DO data 7-day average was 12.21 mg/L and occurred from April 24-30. All raw DO rolling 7-day averages at the Forebay monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

Adjusted DO values were obtained using the HOBOware Dissolved Oxygen Assistant program based on the start and end field calibration check values obtained with a HACH MS5 Sonde. The start and end calibration check values were entered into the program with the corresponding date and time of the DO loggers recorded values. A total of 8,538 adjusted DO values were calculated from the Forebay monitoring station (Table 3 and Appendix C). Adjusted DO values ranged from a low of 2.94 mg/L on August 17 to a high of 12.74 mg/L on May 20. The average adjusted DO values for the six month monitoring period was 8.48 mg/L. Of these adjusted data values, a total of 92 (0.53%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from mid-June to mid-August during low river flow period. The accuracy rating of the adjusted DO values compared to the raw (recorded) data included all four rating classifications. Appendix C provides the number of DO values in each rating classifications: 6,259 (73.31%) Excellent; 1,676 (19.63%) Good; 425 (4.98%) Fair; and 178 (2.08%) Poor.

A total of 179 adjusted daily average DO values were calculated during the monitoring period. The minimum and maximum adjusted daily DO values were 4.95 mg/L on July 4 and 12.33 mg/L on April 25, respectively. The average of the adjusted daily DO values for the entire monitoring period was 8.48 mg/L.

A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 5.73 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was 12.01 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Forebay monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

4.3 Piney Channel Temperature and Dissolved Oxygen

A total of 8,529 water temperature values were recorded from the Piney Channel monitoring station (Table 3). Water temperatures varied each month during the six month monitoring period. Water temperature ranged from a low of 8.42°C (47.16°F) on April 4 to a high of 29.02°C (84.24°F) on July 9. The average water temperature during the six month monitoring period was 21.71°C (71.08°F).

During 2021, three DO data gaps occurred at the Piney Channel Station. One was due to the monitor recording data that exceeded the maximum allowable limit of >±2.0 mg/L or 20%, whichever is greater. This data gap occurred from June 23 at 0400 hour until 1030 hour. The second data gap was attributed to possible debris and occurred on July 18 from 0230 to 0330 hour. The last data gap was due to being removed because of high river flow (>100 kcfs) and occurred from September 2 at 1105 hour until September 7 at 0848 hour. Two Lab calibrations of the Piney Channel HOBO monitor were completed during the monitoring period and occurred on June 23 from 1031 to 1139 hour and on August 24 from 0931 to 1022 hour.

A total of 8,529 DO raw data values were collected from the Piney Channel monitoring station (Table 3 and Appendix D). Raw data DO values ranged from a low of 4.58 mg/L on July 4 to a high of 12.99 mg/L on April 28. The average raw data DO values for the six month monitoring period was 8.78 mg/L. Of these raw data DO values, a total of 31 (0.18%) raw DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low raw DO values occurred periodically from mid-June to July 4.

A total of 179 raw daily average DO values were calculated during the monitoring period. The minimum and maximum raw daily DO values were 5.24 mg/L on July 4 and 12.51 mg/L on April 29, respectively. The average of the raw daily DO values for the entire monitoring period was 8.78 mg/L.

A total of 177 raw DO data rolling 7-day average values were calculated for the monitoring period. The minimum raw DO data rolling 7-day average was 5.94 mg/L and occurred from June 30-July 6. The maximum raw DO data rolling 7-day average was 12.25 mg/L and occurred from April 24-30. All raw DO rolling 7-day averages at the Piney Channel monitoring station met the PA Water Quality State Standard of 5.5 mg/L.

Adjusted DO values were obtained using the HOBOware Dissolved Oxygen Assistant program based on the start and end field calibration check values obtained with a HACH MS5 Sonde. The start and end calibration check values were entered into the program with the corresponding date and time of the DO loggers recorded values. A total of 8,529 adjusted DO values were calculated from the

Piney Channel monitoring station (Table 3 and Appendix D). Adjusted DO values ranged from a low of 4.70 mg/L on July 4 to a high of 12.97 mg/L on April 28. The average adjusted DO values for the six month monitoring period was 8.75 mg/L. Of these adjusted data values, a total of 27 (0.15%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from mid-June to July 4 during low river flow period. The accuracy rating of the adjusted DO values compared to the raw (recorded) data included all four rating classifications. Appendix D provides the number of DO values in each rating classifications: 6,567 (77.00%) Excellent; 1,085 (12.72%) Good; 437 (5.12%) Fair; and 440 (5.16%) Poor.

A total of 179 adjusted daily average DO values were calculated during the monitoring period. The minimum and maximum adjusted daily DO values were 5.38 mg/L on July 4 and 12.32 mg/L on April 29, respectively. The average of the adjusted daily DO values for the entire monitoring period was 8.74 mg/L.

A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 6.02 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was 12.02 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Piney Channel monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

4.4 Tailrace Temperature and Dissolved Oxygen

A total of 8,519 water temperature values were recorded from the Tailrace monitoring station (Table 3). Water temperatures varied each month during the six month monitoring period. Water temperature ranged from a low of 8.38°C (47.08°F) on April 4 to a high of 28.76°C (83.77°F) on July 9. The average water temperature during the six month monitoring period was 21.54°C (70.77°F).

During 2021, two DO data gaps occurred at the Tailrace Station. Both were due to vandalism (the monitor being removed from the tailrace). These two data gaps occurred from August 9 at 1630 hour to August 11 at 1330 hour and from September 17 at 2130 hour to September 21 at 1100 hour. Two Lab calibrations of the Tailrace HOBO monitor were completed during the monitoring period and occurred on June 23 from 1231 to 1337 hour and on August 17 from 1201 to 1247 hour.

A total of 8,519 raw data DO values were collected from the Tailrace monitoring station (Table 3 and Appendix E). Raw data DO values ranged from a low of 0.90 mg/L on June 19 to a high of 12.72 mg/L on April 25. The average raw data DO values for the six month monitoring period was 8.38 mg/L. Of these raw data DO values, a total of 137 (0.78%) raw DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low raw DO values occurred periodically from mid-June to July 6.

A total of 179 raw daily average DO values were calculated during the monitoring period. The minimum and maximum raw daily DO values were 4.72 mg/L on July 4 and 12.55 mg/L on April 25, respectively. The average of the raw daily DO values for the entire monitoring period was 8.37 mg/L.

A total of 177 raw DO data rolling 7-day average values were calculated for the monitoring period. The minimum raw DO data rolling 7-day average was 5.49 mg/L and occurred from June 30-July 6. The maximum raw DO data rolling 7-day average was 12.16 mg/L and occurred from April 24-30. All

but one raw DO rolling 7-day average at the Tailrace monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

Adjusted DO values were obtained using the HOBOware Dissolved Oxygen Assistant program based on the start and end field calibration check values obtained with a HACH MS5 Sonde. The start and end calibration check values were entered into the program with the corresponding date and time of the DO logger's recorded values. A total of 8,519 adjusted DO values were calculated from the Tailrace monitoring station (Table 3 and Appendix E). Adjusted DO values ranged from a low of 0.93 mg/L on June 19 to a high of 12.51 mg/L on May 20. The average adjusted DO values for the six month monitoring period was 8.40 mg/L. Of these adjusted data values, a total of 91 (0.52%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. The low adjusted DO values occurred periodically from June 11 to mid-July during low river flow period. The accuracy rating of the adjusted DO values compared to the raw (recorded) data included three of the four rating classifications. Appendix E provides the number of DO values in each rating classifications: 6,716 (78.84%) Excellent; 1,777 (20.86%) Good; and 26 (0.31%) Fair.

A total of 179 adjusted daily average DO values were calculated during the monitoring period. The minimum and maximum adjusted daily DO values were 4.82 mg/L on July 4 and 12.23 mg/L on April 25, respectively. The average of the adjusted daily DO values for the entire monitoring period was 8.39 mg/L.

A total of 177 adjusted rolling 7-day average DO values were calculated for the monitoring period. The minimum adjusted rolling 7-day average DO was 5.57 mg/L and occurred from June 30-July 6. The maximum adjusted rolling 7-day average DO was 11.92 mg/L and occurred from April 24-30. All adjusted rolling 7-day DO averages at the Tailrace monitoring station met the PA Water Quality State Standard of 5.50 mg/L.

5.0 Discussion

The water quality monitoring season at the Holtwood Project was successful with two interruptions of the data due to the monitor recording data that exceeded the maximum allowable limit of >±2.0 mg/L or 20%, whichever is greater, one each at the Forebay and Piney Channel locations. Removal of the Forebay and Piney Channel monitors due to high water caused one interruption of data at the two monitors. The Piney Channel location had one interruption of data due to possible debris issues. The Tailrace monitor had two interruptions of data due to vandalism (monitor removed from water). All three monitors had two short data interruptions due to the monitor undergoing lab calibrations in June and August.

During 2021, river flow in the Piney Channel was achieved by either operating Unit 1 or by spilling water over Obermeyer Gate #1. When spill occurred, this seemed to increase recorded DO values, but debris often accumulated along the Piney Channel wall and would collect on the cable suspending the Piney Channel continuous monitor. If debris brought the monitor closer to the surface of the water this may have affected the quality of the recorded data by potentially causing increased fouling.

The Forebay location had a total of 131 (0.75%) raw DO values and 92 (0.53%) adjusted DO values that were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. Even though there were low instantaneous DO values at the Forebay, all of the raw and adjusted rolling 7-day

average DO values met the Pennsylvania state standard of 5.50 mg/L. The Piney Channel location had a total of 31 (0.18%) raw DO values and 27 (0.15%) adjusted DO values that were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. Even with the low instantaneous DO values at the Piney Channel, all of the raw and adjusted rolling 7-day average DO values met the Pennsylvania State standard of 5.50 mg/L throughout the monitoring period. At the Tailrace location, a total of 137 (0.78%) raw DO values and 91 (0.52%) adjusted DO values were below the instantaneous Pennsylvania State standard value of 5.0 mg/L. In addition to the low instantaneous DO values recorded by the Tailrace, only one (5.49 mg/L) raw rolling 7-day average DO value was below the Pennsylvania State standard of 5.50 mg/L. The remaining raw and all of the adjusted rolling 7-day average DO values met the Pennsylvania State standard of 5.50 mg/L.

Low DO conditions have been known to occur in the Holtwood Forebay and can result from natural processes in the reservoir, especially during extremely low river flow periods like what was experienced in early July and mid-August 2021. For this reason, Holtwood Project operations does not appear to have a negative effect on the DO levels nor do the low DO values (when observed) have any adverse environmental consequences. This conclusion is based on the Forebay and Piney Channel monitor locations meeting both the raw and adjusted rolling 7-day average DO Pennsylvania State standard of 5.50 mg/L. In addition, the Tailrace monitor location met the Pennsylvania State standard of 5.50 mg/L for all but one raw rolling 7-day average and all the adjusted rolling 7-day average DO values.

6.0 Recommendations

1. Continue to perform weekly calibration checks and maintenance. This will minimize the amount of bio-fouling and provide reliable and accurate DO values. Continue to perform lab calibrations on site at Holtwood during the monitoring period, possibly every 2 month period or as the accuracy rating of the data decreases to a poor rating the frequency could increase to monthly. Keep a spare monitor on hand during weekly checks in case a monitor is damaged/vandalized and data can't be downloaded from monitor. This spare monitor can be deployed the same day to minimize the amount of missing DO values.

2. Continue to remove the Forebay and Piney Channel DO monitors when the river flow is projected to rise above 100,000 cfs. This will help to minimize the damage to the DO monitors that may be subjected to extreme turbulence and high debris loads. Redeploy the DO monitors at the earliest opportunity once the river flow subsides below 100,000 cfs.

2 HANDHELD DO METER CALIBRATION: Calibrate the meter with the DO probe in air saturated (aerated) water.

HACH MS5 SOND6

Time 0805 (prevailing, 24 hr) * CAL Temp 22.5 °C CAL DO 8.65 (mg/l)

Meter # 48939 Meter Temp 22.6 °C Meter DO 8.71 (mg/l)

Meter adj. to OK °C Meter adj to OK (mg/l)

Comments BP = 763.42 Alt = 210' Adj BP = 768.84

3 PRE-RETRIEVAL "CAL END POINT" OR PERFORMANCE CHECK VALUES (at DO monitor location):

Time	Handheld DO Meter	Continuous Monitor	Additional Meter
1100 (24 hr)*	Temp 24.1 °C 2	Temp 24.36 °C **	Temp ____ °C
	DO 7.6 mg/l 5	DO 7.58 mg/l ** @1100 hr	DO ____ mg/l

Comments BP = 765.20 Alt = 120' Adj BP = 768.19

Monitor vandalized removed from tailrace before 2130hr reading on 9-17-21

4 MONITOR RETRIEVAL FOR DATA DOWNLOAD & MAINTENANCE:

Time retrieved (taken out of service) 1101 (prevailing, 24 hr) *

Data Download Location: on site (Lab or Onsite) Time of Download: 1106 (24 hr) *

Applicable Maintenance Performed: 2 (1 = None required; 2 = Sensor cleaned; 3 = DO cap replaced; 4 = Batteries replaced; 5 = Other (____))

*see additional notes below

5 CONTINUOUS MONITOR CALIBRATION: Barometric pressure = ____

Calibration Location: ____ (Lab or Onsite)

DO Calibration*** Method Used: ☐ (1 = LDO 100% SAT; 2 = 0% DO Check; 3 = Other ____)

Time: ____ * Cal Temp ____ (°C) Cal DO ____ . ____ (mg/l)

Method Used: ☐ (1 = LDO 100% SAT; 2 = 0% DO Check; 3 = Other ____)

Time: ____ * Cal Temp ____ (°C) Cal DO ____ . ____ (mg/l)

Time that the monitor was redeployed in the Tailrace 1113 (prevailing, 24 hr) *

NO VALID DATA FROM 9-17-21 @2130 through 9-21-21 @1030hr. The 1100 hr value is valid 1 reading first

6 MONITOR REDEPLOYMENT "CAL BEGIN POINT" MEASUREMENTS (at monitor location):

Time	Handheld DO Meter	Continuous Monitor	Additional Meter
1130 (24 hr)*	Temp 24.1 °C 0	Temp 24.10 °C**	Temp ____ °C
BP = 765.13	DO 7.6 mg/l 9	DO 7.63 mg/l ** @1130 hr	DO ____ mg/l

Comments Alt = 120' Adj BP = 768.22

7 Air Temperature 22.8 °C 73F **Wind Conditions** (Circle one): Calm Light Moderate Gusty Strong **Wind Direction:** ESE 9 mph

Other Sampling Notes: Marietta flow = 29,000 cfs @ 1130 hr. * monitor out of water upon arrival at site 1048 hr; placed ~~back~~ in tailrace at 1050 hr. Based on tailrace level @ 1115 hr monitor would have been under water will have to check data.

* Use 24 hour clock; e.g., 3 AM = 0300 hr 3 PM = 1500 hr

** Record values later from downloaded data at the corresponding time of portable meter measurements.

*** May be done in Lab or Field just prior to deployment, experience to dictate location.
