Gorham Hydroelectric Project
FERC Project No. 2288-057
New Hampshire

1.0 INTRODUCTION

1.1 APPLICATION

On July 28, 2022, Central Rivers Power, NH LLC (CRP) filed an application for a new license with the Federal Energy Regulatory Commission (Commission or FERC) to continue operating the 2.15- megawatt (MW) Gorham Hydroelectric Project No. 2288 (Gorham Project or project).[1] The project is located on the Androscoggin River in the town of Gorham in Coos County, New Hampshire (figure 1).

[1] A license for the project was issued on August 1, 1994, for a term of 30 years, with an effective date of August 1, 1994, and an expiration date of July 31, 2024. *See Pub. Serv. Co. of New Hampshire, 68 FERC ¶ 61,179 (1994).*

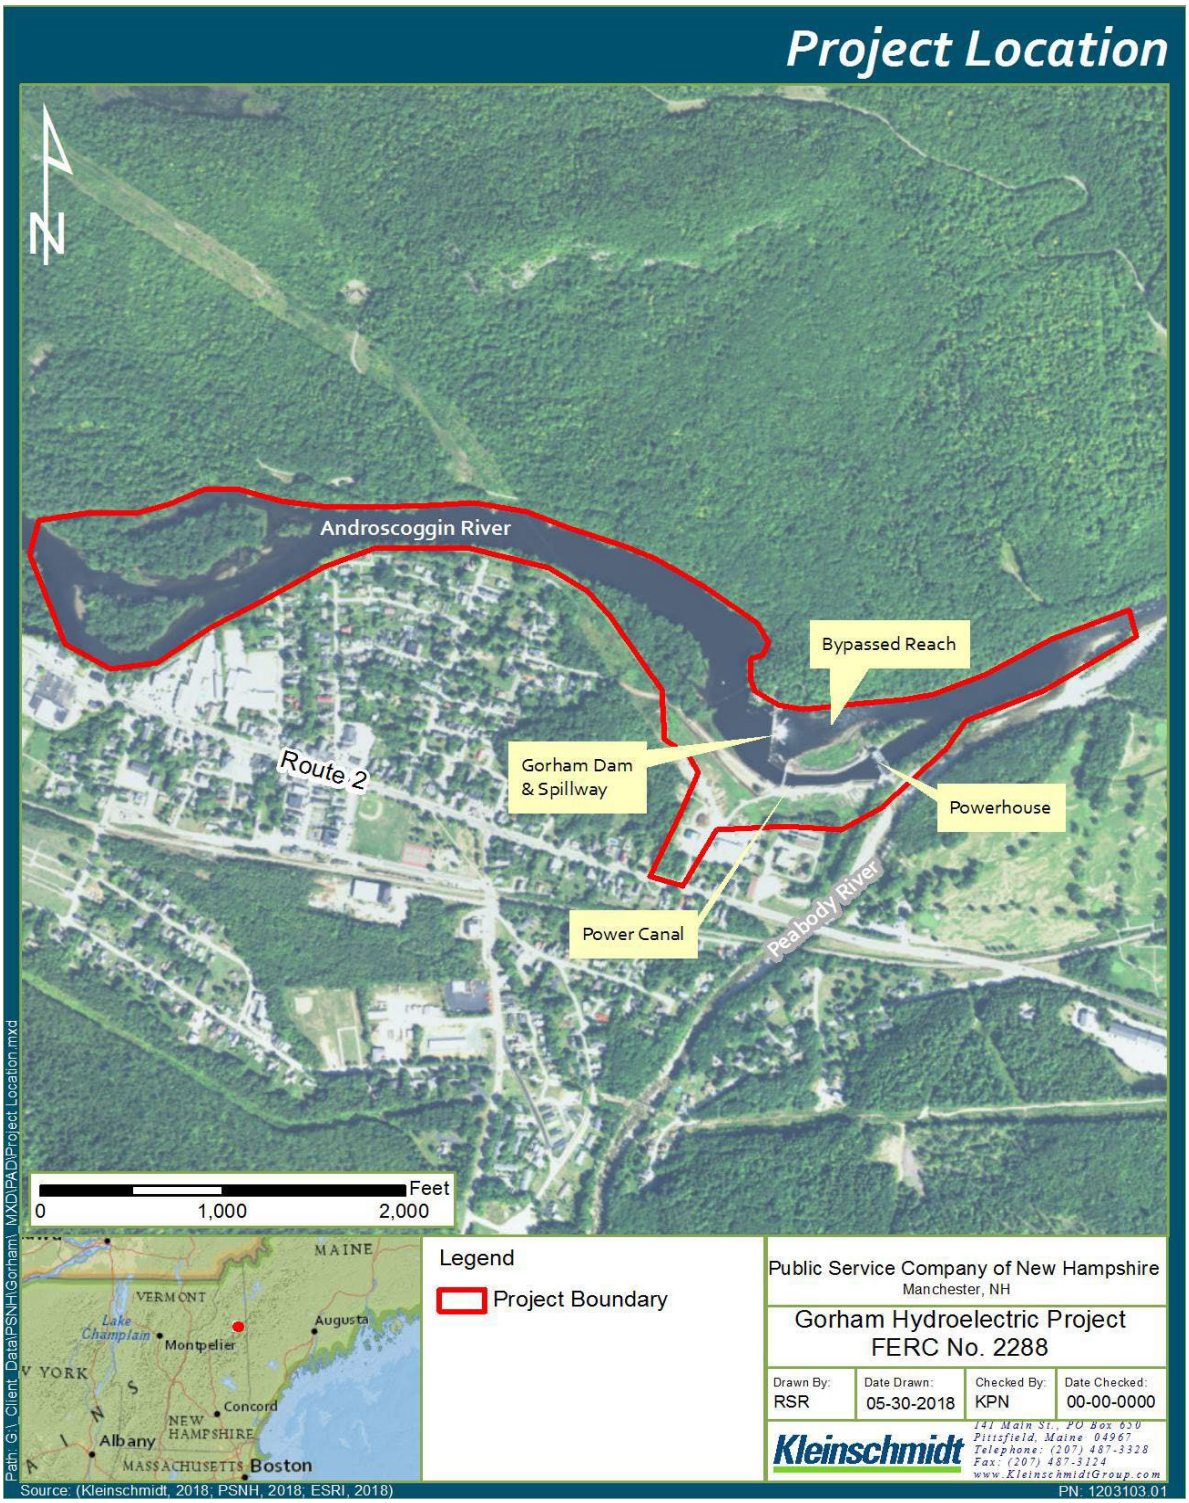

Figure 1. Location of the Gorham Project (Source: license application).

1.2 PURPOSE OF ACTION AND NEED FOR POWER

1.2.1 Purpose of Action

The purpose of the Gorham Project is to provide a source of hydroelectric power. Therefore, under the provisions of the Federal Power Act (FPA), the Commission must decide whether to issue a new license to CRP for the project and what conditions should be placed on any license issued. In deciding whether to issue a license for a hydroelectric project, the Commission must determine that the project would be best adapted to a comprehensive plan for improving or developing a waterway. In addition to the power and developmental purposes for which licenses are issued (such as flood control, irrigation, or water supply), the Commission must give equal consideration to the purposes of: (1) energy conservation; (2) the protection of, mitigation of damage to, and enhancement of fish and wildlife resources; (3) the protection and enhancement of recreational opportunities; and (4) the preservation of other aspects of environmental quality. Issuing a new license for the Gorham Project would allow CRP to continue to generate electricity at the project for the term of a new license, making electric power from a renewable resource available to its customers. We prepared this final environmental assessment (FEA) in compliance with the requirements of the National Environmental Policy Act of 1969 (NEPA),[2] the Council on Environmental Quality (CEQ) regulations for implementing NEPA[3], and the Commission's implementing regulations.[4]

In this EA, we assess the environmental and economic effects of: (1) continued project operation and maintenance as proposed by CRP (proposed action), (2) the proposed action with additional or modified measures (staff alternative), and (3) no action. The primary issues associated with relicensing the project are effects to recreational and cultural resources.

1.2.2 Need for Power

The project has a generating capacity of 2.15 MW and generates an average of 10,727 megawatt-hours (MWh) per year.

To assess the need for power, we look at the needs in the operating region in which the project is located. The North American Electric Reliability Corporation (NERC) annually forecasts electrical supply and demand nationally and regionally for a 10-year period. The Gorham Project is located within the Northeast Power Coordinating Council's New England region (NPCC-New England) of the NERC. According to NERC's 2023 Long-Term Reliability

[2] National Environmental Policy Act of 1969, amended (Pub. L. 91-190. 42 U.S.C. §§ 4321–4347, as amended by Pub. L. 94-52, July 3, 1975, Pub. L. 94-83, August 9, 1975, Pub. L. 97-258, §4(b), September 13, 1982, Pub. L. 118-5, June 3, 2023).

[3] 40 CFR Parts 1500-1508

[4] 18 CFR Part 380.

Assessment, the net internal demand for this region is projected to increase annually by about 1.32% from 2024 to 2033. The anticipated reserve margin (i.e., the primary metric used to evaluate the adequacy of projected generation resources to serve forecasted peak load) is expected to range from 9.2% in 2033 to 27.2% in 2025. The New England region is forecasted to meet NPCC-New England's reference reserve margin from 2024 to 2033, which ranges from 10.0% in 2030 to 12.9% in 2024 (NERC, 2023).

Power from the Gorham Project would continue to help meet the need for power in the NPCC-New England region. The project provides power that can displace generation from non-renewable sources and contributes to a diversified generation mix. Displacing the operation of non-renewable facilities may avoid some power plant emissions, thus creating an environmental benefit.

1.3 STATUTORY AND REGULATORY REQUIREMENTS

The licensing process for the Gorham Project is subject to numerous requirements under the FPA and other applicable statutes. The major regulatory and statutory requirements are described in Appendix A.

1.4 PUBLIC REVIEW AND COMMENT

The Commission's regulations (18 Code of Federal Regulations [C.F.R.], (18 C.F.R. §§ 5.1-5.16) require that an applicant consult with appropriate resource agencies, tribes, and other entities before filing an application for a license. This consultation is the first step in complying with the Fish and Wildlife Coordination Act, Endangered Species Act (ESA), National Historic Preservation Act (NHPA), and other federal statutes. Pre-filing consultation must be complete and documented according to the Commission's regulations.

1.4.1 Scoping

Before preparing this EA, we conducted scoping for the Gorham Project to determine what issues and alternatives should be addressed. We issued an initial scoping document (SD1) requesting written comments on September 18, 2019. It was noticed in the *Federal Register* on September 24, 2019[5] The following entities filed comments on SD1:

Commenting Entity	Date Filed
Appalachian Mountain Club	November 19, 2019
Katherine W. Stuart	November 20, 2019
New Hampshire Department of Environmental Services	November 22, 2019
Pamela Laflamme	November 22, 2019
National Park Service	November 25, 2019
Edith Tucker	November 27, 2019

[5] 84 FR 50030 (Sept. 24, 2019).

A revised scoping document (SD2), addressing these comments was issued on January 2, 2020.

1.4.2 Interventions

On July 26, 2023, the Commission issued a notice accepting the license application and setting September 25, 2023, as the deadline for filing protests and motions to intervene. The following entities filed motions to intervene (none in opposition to the project):

Entity	Date Filed
City of Berlin	September 22, 2023
Town of Gorham	September 22, 2023

1.4.3 Comments on the Application

The July 26, 2023, notice also solicited comments, recommendations, terms and conditions, and prescriptions. The following entities filed comments, recommendations, and prescriptions:

Entity	Date Filed
U.S. Fish and Wildlife Service - New England Field Office	September 11, 2023
U.S. Department of the Interior – Office of Environmental Policy and Compliance[6]	September 20, 2023
City of Berlin and Town of Gorham	September 22, 2023

1.4.4 Comments on the Draft Environmental Assessment

Commission staff issued its draft EA (DEA) for the relicensing of the Gorham Hydroelectric Project on April 5, 2024.[7] Comments on the DEA were due by May 6, 2024.[8] The following entities filed comments on the DEA:

Commenting Entity	Date Filed
CRP	May 3, 2024

[6] Interior submitted the comments on behalf of the NPS.

[7] A notice was published in the *Federal Register* on May 17, 2024. 89 FR 43394.

[8] The notice established a 30-day period for filing comments. The Commission's Rules of Practice and Procedure provide that if a filing deadline falls on a Saturday, Sunday, holiday, or other day when the Commission is closed for business, the filing deadline does not end until the close of business on the next business day. 18 C.F.R. § 385.2007(a)(2). Because the 30-day filing deadline fell on a weekend (i.e., May 5, 2024), the filing deadline was extended until the close of business on Monday, May 6, 2024.

Appendix K summarizes the comments that were filed, includes our responses to those comments, and indicates where we made modifications to the EA.

2.0 PROPOSED ACTION AND ALTERNATIVES

2.1 NO-ACTION ALTERNATIVE

Under the no-action alternative, the project would continue to operate under the terms and conditions of the current license, and no new environmental protection, mitigation, or enhancement measures would be implemented. We use this alternative to establish baseline environmental conditions for comparison with other alternatives.

2.1.1 Existing Project Facilities

The project consists of a dam, impoundment, power canal, powerhouse, transmission line, and appurtenant facilities. The project dam is a 417-foot-long, 14-foot-high timber crib, L-shaped dam consisting of three sections from west to east: (a) a 89.5-foot-long spillway with steel sheet pile facing at a crest elevation of 772.23[9] topped with 1.85-foot wooden timbers; (b) an approximately 253-foot-long spillway with a 3-inch wooden plank facing at a crest elevation of 768.19 feet and topped with 4.6-foot-high hinged wooden flashboards; and (c) a 75-foot-long reinforced concrete sluiceway with at a crest elevation of 768.2 feet and topped with 4.88-foot-high hinged wooden flashboards. Flow into the sluiceway is regulated by one 15-foot-wide sluice gate. The dam creates an impoundment that has surface area of approximately 32 acres at a water surface elevation of 773.5 feet.

An 80-foot-long, 15-foot-wide wooden gatehouse is located adjacent to the western dam section and consists of five intakes separated by concrete piers. The gatehouse controls flow to a 415-foot-long, 60-foot-wide, 20-foot-deep earthen power canal that conveys flows to the powerhouse. The powerhouse consists of 3 sections: (a) a 38-foot-long, 26-foot-wide north section that contains two 400-kilowatt (kW) Allis-Chalmers generators driven by two vertical Francis turbines, (b) a 70-foot-long, 33-foot-wide south section that contains two 675-kW Allis-Chalmers generators driven by two vertical, propeller-type turbines, and (c) a 38-foot-long, 33-foot-wide middle section. The total minimum and maximum hydraulic capacities of the four units are 700 and 2,800 cubic feet per second (cfs) respectively. After passing through the turbine-generator units, flow discharges to a 350-foot-long tailrace and converges with the mainstem river, creating an 850-foot-long bypass reach. Power from the project is transmitted over a 200-foot-long, 33-kV above-ground transmission line to a substation where it joins the local distribution system.

[9] All elevations in this document are based on the National Geodetic Vertical Datum of 1929 (NGVD29).

Project recreation facilities include parking, a canoe portage with a put-in and take-out, an informational kiosk, and informational signage.

2.1.2 Current Project Boundary

The current project boundary encloses approximately 79.6 acres and includes the project facilities listed above in section 2.1.1. The project does not occupy federal land.

2.1.3 Project Safety

The Gorham Project has been operating under the current license issued in 1994. During this time, Commission staff has conducted operational inspections focusing on the continued safety of the structures, identification of unauthorized modifications, efficiency, safety of operations, compliance with the terms of the license, and proper maintenance. In addition, the project has been inspected and evaluated every 5 years by an independent consultant, and a consultant's safety report has been submitted for Commission review.

As part of the relicensing process, Commission staff will evaluate the continued adequacy of the proposed project facilities under a new license. Special articles will be included in any license issued, as appropriate. Commission staff would continue to inspect the project during the new license term to assure continued adherence to Commission-approved plans and specifications, special license articles relating to construction (if any), operation and maintenance, and accepted engineering practices and procedures.

2.1.4 Current Project Operation

The Gorham project operates in a run-of-river mode, by maintaining the impoundment level within 2 inches of the normal full pond level of 772.53 feet such that at any given point in time, all outflow from the project approximates all inflow to the project. CRP provides a minimum flow of 200 cfs or inflow, whichever is less, into the 850-foot-long bypassed reach through a lowered flashboard near the middle of the dam. From June to October, CRP operates units 1,2,3 first and unit 4 the last, while from November to May, unit 4 goes online first followed by unit 3, 2, and 1. The generating units are typically operated remotely by Customized Energy Solution (CES) in Philadelphia, Pennsylvania but are capable of local operation. Manual operations and maintenance of the Gorham Project are performed by the Upper Hydro Group, which is also responsible for the J. Brodie Smith Project (FERC No. 2287) located upstream of the Gorham Project, and Canaan Project (FERC No. 7528) located in northern New Hampshire on the Connecticut River. The project has an average annual energy production value of approximately 10,368 MWh.

2.2 CRP'S PROPOSAL

2.2.1 Proposed Project Boundary Modification

CRP proposes to remove from the project boundary 1.84 acres of undeveloped, grassy land adjacent to the Route 2 access road and recreational parking area. According to CRP, this

parcel serves no project purpose and is periodically mowed by the Gorham Public Works Department.

2.2.2 Proposed Operation and Environmental Measures

CRP does not propose any new development or changes in project operation from its current license. CRP proposes to:

- Continue to operate the project as a run-of-river facility by maintaining the impoundment level within 2 inches of the normal full pond level of 772.53 feet such that at any given point in time, all outflow from the project approximates all inflow to the project.
- Continue to provide a minimum flow of 200 cfs or inflow, whichever is less, to the project's bypassed reach.
- Implement an updated Operations Compliance Plan.
- Continue to operate and maintain the project's existing recreation facilities: (1) a canoe portage, take-out and put-in with directional signage; (2) an informational kiosk located on the north shore of the impoundment containing maps and other recreation information; (3) informational signage located at the Route 2 entrance to the project and on Hogan Road; and (4) an approximately 20-foot by 60-foot gravel parking area with space for six vehicles and one designated ADA parking space located off Route 2.
- Continue to implement the 1996 Cultural Resources Management Plan[10] (CRMP) to protect historic resources.

2.3 STAFF ALTERNATIVE

Under the staff alternative, any new license would require CRP's proposed measures described above in sections 2.2.2 except for implementing the 1996 CRMP because it does not conform to current guidelines.

The staff alternative also includes the following measures:

- Avoid removal and trimming of trees equal to greater than 3 inches diameter at breast height (dbh) from April 15 through October 31 to protect northern long-eared and tri-colored bats, unless the trees represent a public safety hazard.
- Develop a Historic Properties Management Plan (HPMP), implemented by a programmatic agreement (PA), within one year of license issuance to provide for the management of historic properties that are eligible for or listed on the National Register of Historic Places (National Register) within the project's area of potential effect (APE).

[10] Filed with the Commission on July 29, 1996.

2.4 ALTERNATIVES CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS

Certain alternatives to CRP's proposal were considered but eliminated from further analysis because they are not reasonable in this case. These alternatives are discussed in Appendix B.

3.0 ENVIRONMENTAL ANALYSIS

This section includes a general description of the project's vicinity and our analysis of the proposed action and other recommended environmental measures. Tables and Figures that are referred to in this section can be found in Appendix C. Sections are organized by resource area, with historical and current conditions described first. The existing condition is the baseline against which the environmental effects of the proposed action and alternatives are compared, including an assessment of the effects of proposed mitigation, protection, and enhancement measures. Staff conclusions and recommended measures are discussed in Appendix F, *Comprehensive Development and Recommended Alternative*.[11]

3.1 GENERAL DESCRIPTION OF THE RIVER BASIN

The Androscoggin River begins in northwestern Maine at Umbagog Lake, crosses into northern New Hampshire, then re-enters Maine near Bethel, eventually joining the Kennebec River at Merrymeeting Bay in coastal Maine. The Androscoggin River drops 1000-feet from its headwaters to the Atlantic Ocean, with an average descent of 8-feet per mile. The watershed has a total drainage area of 3,450-square-miles, with 720-square-miles of drainage in New Hampshire. Flows in the Androscoggin River are regulated by large predominately storage reservoirs upstream of Umbagog Lake: Kennebago, Mooselookmeguntic, Upper and Lower Richardson, and Aziscohos. There are eight hydroelectric projects including the Gorham Project within an 11-mile-long, high gradient reach of the river between Berlin and Shelburne, New Hampshire that are seeking new licenses concurrently.[12] The Androscoggin River Basin contains over 200 dams, most of which are on various tributaries to the mainstem.

3.2 SCOPE OF CUMULATIVE EFFECTS ANALYSIS

According to the Council on Environmental Quality's regulations for implementing the National Environmental Policy Act (40 C.F.R., § 1508.7), a cumulative effect is the impact on

[11] Unless noted otherwise, the source of our information is the final license application filed on July 28, 2022, and supplemented on April 17, 2023, May 22, 2023, July 14, 2023, and October 23, 2023.

[12] Relicense applications on the upper Androscoggin River pending before the Commission include CRP's J. Brodie Smith (P-2287) and Gorham (P-2288) Hydroelectric Projects, and Great Lakes Hydro America LLC's Shelburne (P-2300), Upper Gorham (P-2311), Cross Power (P-2326), Cascade (P-2327), Sawmill (P-2422), and Riverside (P-2423) Hydroelectric Projects.

the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions. Cumulative effects can result from individually minor but collectively significant actions taking place over time, including hydropower and other land and water development activities.

Based on our review of the license application and agency and public comments, we have not identified any resources that may be cumulatively affected by the proposed operation and maintenance of the Gorham Project. During scoping no entity identified any resources that would be cumulatively affected by licensing the Gorham Project or any of the other 7 projects that are concurrently undergoing relicensing. This is because the projects are operated run-of-river, water quality is good and much improved over historic conditions, the projects are above anadromous fish barriers, and there are no other actions occurring in the basin that would affect these resources. Therefore, cumulative effects are not considered further in the EA.

3.3 PROPOSED ACTION AND ACTION ALTERNATIVES

In this section, we discuss the effects of the project alternatives on environmental resources. For each resource, we first describe the affected environment, which is the existing condition and baseline against which we measure effects. We then discuss and analyze the environmental effects of the project alternatives.

Only the resources that would be affected are addressed in this EA. We have not identified any substantive issues related to geology and soils, land use, or aesthetic resources associated with the proposed action, and therefore, these resources are not addressed in this EA. We also consider the effects of the project on environmental justice communities. We present our recommendations in Appendix F, *Comprehensive Development and Recommended Alternative*.

3.3.1 Aquatic Resources

3.3.1.1 Affected Environment

Water Quantity

Five large water storage reservoirs (Rangeley, Aziscohos, Upper and Lower Richardson Lakes, Mooselookmeguntic, and Umbagog) in the Upper Androscoggin watershed are operated to maintain a target flow of 1,550 cfs at Berlin, NH, year-round. The system has a combined storage capacity of approximately 644,000 acre-feet. Flow regulation occurs at the Errol Hydroelectric Project (FERC No. 3133), which impounds Lake Umbagog, approximately 30 river miles upstream of the Gorham Project area.

River flow data for the Gorham Project was obtained from USGS gage #01054000 (Androscoggin River near Gorham, New Hampshire). The drainage area at the USGS gage is approximately 1,361 square miles. The data from the USGS gage are considered representative of the flows throughout the project area.

Annual and monthly river flows for the Androscoggin River at USGS gage #01054000 from January 1, 1991, to December 31, 2020, are provided in Table 1. Annual average, minimum, and maximum flows are estimated to be 2,805 cfs; 780 cfs; and 19,900 cfs, respectively. The maximum monthly average flow (4,751 cfs) is typically in April and the minimum monthly average flow is typically in September (1,840 cfs). The maximum recorded daily average flow (19,900 cfs) occurred on April 1, 1998, and the minimum daily average flow (780 cfs) occurred on September 4, 2015.

The Androscoggin River in the area of the project is used for hydroelectric power generation, recreation, wastewater assimilation, and aquatic and wildlife habitat. There are no current or proposed water withdrawals or consumptive uses of water at the Gorham Project.

Water Quality

The Androscoggin River in the 11-mile stretch that includes eight hydroelectric projects (including the Gorham Project) is classified by the state of New Hampshire as a Class B water. The designated uses of Class B surface waters in New Hampshire are aquatic life, fish consumption, potential drinking water supply, swimming and other recreation in and on the water, and wildlife. Class B waters are "considered acceptable for fishing, swimming and other recreational purposes, and, after adequate treatment, for use as water supplies" (NHDES 2020). Water quality criteria for Class B waters in New Hampshire are provided in Table 2.

2020 Water Quality Study

As a part of the re-licensing process, CRP completed a comprehensive water quality study throughout the 11-mile-long multi-project area during late June to October 2020. CRP collected dissolved oxygen (DO), water temperature, pH, nutrients, chlorophyll-a, and Secchi disk data at the deepest spot in each project impoundment; and DO, water temperature, and pH in a riverine reach upstream of the impoundment, in the bypassed reach of the project, in the tailrace of the project, and downstream of the tailrace and bypass reach confluence.

The average water temperature (20.0 Degrees Celsius (ºC) to 21.3ºC), DO concentration (8.5 Milligrams per liter (mg/L) to 8.9 mg/L), DO percent saturation (97.1 percent to 102.8 percent), and pH (6.6 to 6.9) were similar at the five monitoring sites at the Gorham Project (Table 9). A diurnal variation in the DO concentration, DO percent saturation, water temperature, and pH was observed throughout the Gorham Project area. DO, pH, and water temperature had higher levels during the day and minimum levels overnight to early morning. This trend indicates the influence of biological processes (e.g., photosynthesis, respiration) on water quality.

The DO concentration and daily average DO percent saturation exceeded the state standards (5.0 mg/L and 75 percent saturation) throughout the study period. In July, DO ranged between 7 mg/L and 9 mg/L except during the time periods with cooler water temperatures and high flows when it increased to over 9 mg/L (e.g., July 1-3, July 14-18). DO primarily varied between 6 mg/L and 9.5 mg/L through the end of August. In early to mid-September, DO was between 8 mg/L and 10 mg/L. During the last several days of the study (September 19-24), DO was between 9.5 mg/L and 11 mg/L. The date of the minimum DO concentration varied with

site; the maximum DO levels at all sites were observed on September 21 and 22. The instantaneous DO percent saturation ranged from 62.3 percent to 110.3 percent, and the daily average DO percent saturation ranged from 84.5 percent to 108.0 percent.

The minimum water temperature (11.9ºC to 13.4ºC) was observed on September 21, 22, or 23 depending on site; the maximum water temperature (24.8ºC to 26.2ºC) was observed on August 12 at all sampling sites. At the beginning of the water quality monitoring in late June, the water temperature was approximately 21ºC and ranged between 22ºC and 26ºC through mid-August (excluding the high flow events). The water temperature decreased to around 18ºC at the end of August and increased to 20ºC to 22ºC on September 9-10. At the end of the monitoring period, the water temperature was near 13ºC. The water temperature at the above impoundment site was typically 0.5ºC to 1.5ºC lower than the other monitoring sites, particularly during the high flow events. The cooler temperatures likely reflect inflow from the Moose River which enters the Androscoggin River approximately 350 feet upstream of the above impoundment monitoring site. Water temperatures in the Moose River, which is a tributary fed by small, flashy, high elevation mountain brooks and streams from the Crescent Range and North side of the Presidential Range, are likely cooler than at lower elevations where sampling occurred.

pH was within the range of the state standard (6.5 to 8.0) for 90.6 percent of the study period in the tailrace and ranged from 6.0 to 7.1. pH exhibited different trends at the tailrace than the other sites, the cause of which is unknown. pH met the standard for 98.1 percent to 99.9 percent of the study period at the other four monitoring sites. pH was lowest at all sites (5.8 to 6.3) on July 14 (also on August 16 in the tailrace) with maximum values of 6.9 or 7.1 on several days. pH was below the standard (6.5) for short periods at the above impoundment, impoundment, bypass reach, and downstream confluence sites on July 1, 2, 14, or 15 during the high flow events with cooler water temperatures.

Water temperature and DO were uniform throughout the water column demonstrating that the impoundment did not thermally stratify. The average water temperature throughout the water column ranged from 18.3ºC on September 3 to 24.3ºC on July 30. The water temperature varied by 0.2ºC or less in each profile. The average DO throughout the water column ranged from 7.9 mg/L on August 13 to 9.3 mg/L on July 16. The average DO percent saturation ranged from 92.4 percent on August 13 to 102.9 percent on July 16. The DO concentration and percent saturation varied by 0.6 mg/L or less and 3.3 percent or less, respectively, throughout the water column in each profile. The DO concentration was above the 5.0 mg/L standard in all profiles.

Fisheries Resources

Historically, the upper Androscoggin River near Berlin, New Hampshire, was heavily polluted due to point source discharges from municipal, paper mill, and textile effluents (Inglis et al. 2014, Yoder et al. 2006a, Boucher 1997). Pollution from point source discharges, dams, timber drives, land use practices, non-native fish species, and over-fishing all contributed to a decline in the quality of the fishery (AMC 2003, Boucher 1997). Improvements to water quality since the 1970s resulting from regulations, new municipal and industrial treatment facilities, and the establishment of more stringent water quality standards have allowed the reach of the river between Berlin and Shelburne (i.e., near the GLHA NH Projects) to improve as a recreational

and ecological resource (Inglis et al. 2014). However, NHDES continues to recommend that fish from Berlin, New Hampshire, to the Maine border not be consumed because of elevated dioxin and mercury levels resulting from past industrial discharges (NHDES 2021).

The upper Androscoggin River supports approximately 30 species of fish, a quarter of which are non-native (AMC 2003). Angling for salmonids is bolstered by trout stocking and wild reproduction in the upper watershed and within tributaries. Cold water inflow from tributaries and regulated water releases from upper storage reservoirs enhances coldwater fisheries habitat in the main stem of the Androscoggin River. The Midwest Biodiversity Institute (MBI) sampled 51 sites in the Androscoggin River in 2003 to document the spatial distribution and relative abundance of fish in large, non-wadeable river systems of the northeastern United States (Yoder et al. 2006a). MBI electrofished nine 0.6-mile-long reaches within or near GLHA's six hydropower projects in the upper Androscoggin River (figure 1), collecting 3,378 fish representing 18 species (table 4). MBI's overall catch was dominated by common fish species from the northeastern United States, including fallfish (30.6 percent), smallmouth bass (26.3 percent), white sucker (14.9 percent), and longnose dace (10.7 percent); common shiner (6.4 percent) and spottail shiner (4.2 percent) were also relatively abundant.

Other species, such as rainbow trout, bullhead, and yellow perch were less common (i.e., less than or equal to 2 percent of the total catch). Smallmouth bass and white sucker were the most common species in riverine segments; smallmouth bass and fallfish were the most common species in the impounded segments (Yoder et al. 2006a). Rainbow trout and brown trout were present but not predominant. Species richness ranged from 5 to 12 in sampled reaches. Maine DIFW reports that burbot and chain pickerel also occur in the upper Androscoggin River (Brautigam and Pellerin 2014).

3.3.1.2 Environmental Effects

Run-of-River Operation, Impoundment Levels, and Minimum Flow

Flow fluctuations during the operation of hydropower projects can affect shoreline littoral and riverine habitat in impoundments and downstream reaches by exposing them to periodic dewatering, making them unsuitable for aquatic biota. Flow fluctuations can also increase erosion of project shorelines, particularly in a project's reservoir.

CRP proposes to continue operating the project as a run-of-river, such that the impoundment level is maintained within 2 inches of the normal full pond level of 772.53 feet Additionally, CRP proposes to continue to provide a minimum flow of 200 cfs or inflow, whichever is less, to the bypassed reach of the Gorham Project.

Staff Analysis

Continuing to operate the project in run-of-river mode would continue to minimize fluctuations in the project impoundment and in the Androscoggin River downstream of the project. Maintaining stable impoundment levels would continue to protect shoreline habitat and fish and other aquatic organisms that rely on near-shore habitat in the impoundment for

spawning, foraging, and cover. Minimizing flow fluctuations downstream of the project would also continue to protect aquatic habitat and minimize fish stranding potential.

Under CRP's proposal to continue to provide a minimum flow of 200 cfs or inflow, whichever is less, into the bypassed reach, there would be no change to aquatic habitat or species found to this reach from existing conditions. The amount of aquatic habitat in the bypassed reach would remain the same. Water quality parameters such as temperature and DO would remain consistent with current conditions. There is no evidence of problems with existing aquatic biota and flows are sufficient to maintain aquatic habitat.

Operations Compliance Plan

CRP proposes to develop and implement an updated Operations Compliance Plan to confirm the project is operated in compliance with a new FERC license. CRP did not provide additional details as to the content of the plan.

Staff Analysis

It is essential that a licensee be able to demonstrate compliance with all operational requirements of a project. Compliance with the proposed run-of-river operation and proposed minimum flow releases could be achieved through the development and implementation of an over-arching operation compliance monitoring plan. This plan would detail how CRP plans to monitor compliance with the operational requirements of any license that may be issued. This plan would also detail how CFP would notify both the Commission and resource agencies of any non-compliance events.

3.3.2 Terrestrial Resources

3.3.2.1 Affected Environment

The project is located in a forested basin lined with mixed evergreen and deciduous trees. Lands within the project boundary are limited predominately to the riparian habitats along the river and developed areas associated with the town of Gorham. Approximately 0.35 square miles wetlands are present within a one-mile buffer of the project boundary. These lands can support a variety of wildlife, including large game species and birds. According to the license application, one bald eagle was observed nearby in 2012 and seven invasive plant species have been found at low to moderate densities within the project area. There is no evidence that invasive species are currently affecting project operation or other environmental resources.

3.3.2.2 Environmental Effects

Flow fluctuations during operation of hydropower projects can affect wetland and riparian habitats by exposing them to periodic water level changes, decreasing the area of such habitat and its value to wildlife. The applicant proposes to continue to operate the project in a run-of-river mode with inflow approximating outflow. No recommended measures for terrestrial resources were made by licensing participants or are being proposed.

Staff Analysis

There is no evidence in the project record that the current operational mode adversely affects wildlife habitat. Operating the project in a run-of-river mode minimizes effects of flow fluctuations to riparian habitat both upstream and downstream of the project. Project operations involving small fluctuations to flow in the river downstream of the powerhouse are not expected to result in large-scale changes in the composition, structure, or function of existing riparian plant and animal communities. Therefore, continuing previous operational procedures would maintain existing terrestrial habitat upstream and downstream of the project.

3.3.3 Threatened and Endangered Species

On February 8, 2024, staff used the U.S. Fish and Wildlife Service's (FWS's) Information for Planning and Consultation (IPaC) database to determine whether any federally listed species could occur in the vicinity of the project.[13] According to the IPaC database, the threatened Canada lynx, the endangered northern long-eared bat (NLEB), and the candidate monarch butterfly may occur within the project boundary or be affected by the project. In addition, FWS proposed on September 14, 2022, to list the tricolored bat as endangered. Based on FWS range information, tricolored bats may also occur within the project boundary or be affected by the project. Effects on threatened and endangered species are discussed in Appendix D, *Biological Assessment* (BA). In the BA, staff conclude that relicensing the project as proposed with the staff-recommended measure of tree-cutting restrictions from April 15 through October 31, may affect, but is not likely to adversely affect the NLEB. Similarly, we conclude that relicensing the project with tree-cutting restrictions from April 15 through October 31 is not likely to jeopardize the continued existence of the tricolored bat and is not likely to adversely affect this species. We also conclude that the project will have no effect on the Canada lynx and the monarch butterfly.

3.3.4 Recreation Resources

3.3.4.1 Affected Environment

The Gorham Project is in the Great North Woods region of New Hampshire. This region is known for its open wilderness, hiking trails, mountain peaks, and scenic views. The town of Gorham often serves as a center point for accessing the many recreational opportunities throughout the region, including the Mount Washington Auto Road which begins in Gorham. The White Mountain National Forest and the Presidential Range of the White Mountains are located just south of Gorham, New Hampshire.

Project Recreation Facilities and Use

Recreation opportunities at the Gorham Project include canoeing, kayaking, bank fishing, boat fishing, biking, scenic and nature viewing, picnicking, and walking. Project recreation

[13] *See* FWS, IPaC, https://ecos.fws.gov/ipac/ (last visited February 8, 2024).

facilities include: (1) a canoe portage, take-out and put-in with directional signage; (2) an informational kiosk located on the north shore of the impoundment containing maps and other recreation information; (3) informational signage located at the Route 2 entrance to the project and on Hogan Road; and (4) an approximately 20-foot by 60-foot gravel parking area with space for six vehicles and one designated ADA parking space located off Route 2. Access to the project impoundment from the parking area on Route 2 is via an approximately 800-foot walking path. Public parking for four vehicles is also available near the powerhouse.

The canoe take-out is located approximately 500 feet upstream of the dam on river right. The 2,250-foot-long portage path travels alongside the south side of the project, changing between gravel and grass. The put-in site is located at the end of the peninsula downstream of the powerhouse. There are two canoe portage signs located along the portage path. Opportunities for fishing are available from the portage path downstream of the powerhouse. A picnic table is located near the powerhouse along the portage path. The canoe portage, take-out, put-in, and picnic table are owned and maintained by CRP.

In addition to the facilities provided by the project, the Town of Gorham, working with the Northern Forest Canoe Trail, enlarged and improved a new parking area off Howland Avenue, installed a floating dock at the take-out above the Gorham Dam, and installed new stone steps at the put-in below the dam during the summer of 2023 to improve access above and below the Gorham Dam. [14] The parking area off Howland Avenue accommodates 10 vehicles, is outside the project boundary, and is owned and will be maintained by the Town of Gorham. Figure 2 shows the location of the Gorham Project recreation sites.

CRP provides regular maintenance at the Gorham facilities, including repair and grading of gravel walking paths/roadways and parking areas, mowing/weed whacking of grass areas, and disposal of litter. CRP estimates the annual maintenance cost of recreation facilities to be approximately $10,000 per year.

Recreation Use

According to previously filed Form 80 reports, the total number of recreation days[15] at the Gorham Project decreased from the year 2003 (977 days) to 2015 (870 days); therefore, capacity utilization also decreased from 25 percent to 15 percent.

CRP conducted a Recreation Use and Facility Assessment to support relicensing. The study examined 14 public access sites along the Androscoggin River in the towns of Berlin,

[14] More information from the northern Forest Canoe Trail, including photographs of improvements are available online at https://www.northernforestcanoetrail.org/projects-enhance-access-to-androscoggin-river/

[15] A recreation day is defined as each visit by a person to a development for recreational purposes during any portion of a 24-hour period.

Gorham, and Shelburne, New Hampshire, between May 15 and September 15, 2022. [16] Components of the study included a facility inventory, spot counts, user surveys, and consultation with agencies and stakeholders.

Both local and out-of-town recreationists used the facilities at the Gorham Project for hiking/walking, bank fishing, fly/wade fishing, dog walking, and snowshoeing. Most survey respondents rated the crowdedness of the project's recreation facilities as light and the parking as under capacity; responded that the Gorham recreation area was in satisfactory, good, or excellent condition; and were satisfied with the available number and type of facilities. Overall, the existing recreation-related water access opportunities were rated as adequate.

3.3.4.2 Environmental Effects

CRP proposes to continue to maintain and operate the existing project recreation facilities.

No recommendations were provided in response to the Commission's ready for environmental analysis notice.

Staff Analysis

Recreation use at the Gorham Project is currently light and the facilities are meeting recreation needs now and for the foreseeable future. CRP would continue to maintain the take-out, portage trail, and put-in and the Town of Gorham would maintain the new parking lot off Howland Avenue and dock. With these enhancements in place and continued maintenance of CRP's picnic table, parking at the powerhouse, and north shore kiosk and access, there does not appear to be any need for additional recreation measures at the project.

3.3.5 Cultural Resources

3.3.5.1 Affected Environment

Section 106 of the National Historic Preservation Act (NHPA) requires that the Commission take into account the effects of its actions on historic properties and afford the Advisory Council on Historic Preservation a reasonable opportunity to comment on the undertaking.[17] Historic properties are those that are listed or eligible for listing in the National Register of Historic Places (National Register). The regulations implementing section 106 of the NHPA also require that the Commission seek concurrence with the State Historic Preservation

[16] A total of 8 surveys were completed at the Gorham sites.

[17] An undertaking means "a project, activity, or program funded in whole or in part under the direct or indirect jurisdiction of a Federal agency, including those carried out by or on behalf of a Federal agency; those carried out with Federal financial assistance; and those requiring a Federal permit, license, or approval." 36 C.F.R. § 800.16(y). Here, the undertaking is the potential issuance of a new license for the Gorham Project.

Office (SHPO) on any finding involving effects or no effects on historic properties. In this EA, we also use the term "cultural resources" for properties that have not been determined eligible for listing in the National Register. Cultural resources represent things, structures, places, or archaeological sites that can be either prehistoric or historic in origin. In most cases, cultural resources less than 50 years old are not considered historic.

On September 18, 2019, the Commission designated CRP as the non-federal representative for carrying out day-to-day consultation regarding the licensing efforts, pursuant to section 106 of the NHPA. However, the Commission remains largely responsible for all findings and determinations regarding the effects of the project on any historic property.

Area of Potential Effects (APE)

Pursuant to section 106 of the NHPA, the Commission must take into account whether any historic property could be affected by the issuance of a license within a project's area of potential effects (APE). The APE is determined in consultation with the SHPO and is defined as the geographic area or areas within which an undertaking may directly or indirectly cause alternation in the character or use of historic properties, if any such properties exist. The APE for this project consists of all lands within the current project boundary. [18]

Regional Historic Background

The Gorham Project is one of two hydroelectric projects on the Androscoggin River in the Village of Gorham.[19] The Androscoggin River is one of the major river systems of New England. Through the nineteenth and early twentieth centuries, a succession of dams was used for either industrial uses or power production. The Androscoggin River, like the Kennebec and Penobscot Rivers in Maine, flows through what had been densely forested regions of Maine and New Hampshire, creating an enormous lumber and forest products industry along the Androscoggin.

Gorham is located in the Androscoggin River valley, close to and surrounded by the White Mountains and their foothills; this proximity is what, as early as the mid-nineteenth century, drew visitors to the village. In 1770 a group of investors received a grant from Colonial Governor John Wentworth in what is now the Town of Shelburne, lying downriver and to the east of Gorham. The grant required that the grantees improve the land and attract a specified number of settlers. Upon arriving at the grant, however, the grantees learned that the land was too mountainous and that its terrain would not allow sufficient agricultural production to support the required number of settlers. In response, Governor Wentworth provided an additional grant of land, encompassing what is now Gorham; this land was then known as the Shelburne

[18] According to the license application, CRP consulted the SHPO for all surveyed structures within the area of potential effect (APE); therefore, we assume SHPO concurrence on the APE.

[19] The Upper Gorham Hydroelectric Project that is owned and operated by Great Lakes Hydro Associates, is located approximately 2.5 river miles upstream of the Gorham Project.

Addition. This remained the name of the area until the Town of Gorham was incorporated in June 1836.

The community is located at the eastern edge of the White Mountains, providing access to what is known as the Presidential Range including Mt. Adams and Mt. Jefferson together with Mt. Washington, the highest peak in the northeastern United States. The peak had been a travel destination for many years before the 1850s, but access was difficult. The arrival of the railroad, however, gave life to the business of catering to travelers who sought the wilderness experience at Mt. Washington. The White Mountain Station House was built in Gorham in 1851 to provide accommodations to the new wave of tourists, while other hotels opened in Gorham throughout the late nineteenth century. With impetus from the railroad shops and tourism, Gorham grew quickly through the late nineth and early twentieth centuries, and nearby Berlin emerged as the industrial center for the region.

Archeological and Architectural Investigations

Previous archeological investigations, include a Phase 1 archeological study (Gengras & Bolian, 1991)[20] that identified two historic sites in the APE: (1) the Eddy Bridge site comprising abutments for a suspension bridge built in 1877 associated with the Mascot Mine, and the (2) Logging Boom site, containing logging cribs and boom. Both sites are continuously inundated behind the dam and unaffected by on-going project operations.[21]

According to the Phase I archeological study, no prehistoric resources were identified at the project; however, high prehistoric resource potential was identified at Buck Island at the northern end of the project boundary[22] and moderate potential was identified at two terraces on the north side of the Androscoggin.

Records from Public Service of New Hampshire, the former owner of the Gorham Project, indicate that the first powerhouse at the site was built in 1894. Part of the existing Gorham powerhouse was built in 1909. Additional parts of the Gorham Project were built from 1917 to 1923 in stages by the Twin State Gas and Electric Company. In addition, the dam was enlarged several times, in 1903, and 1927-1928. In 1959, the original dam was replaced with the existing dam. CRP reviewed the project facilities in 2021 to determine they were eligible for listing on the National Register. The survey, filed with the Commission on June 7, 2021, found that the only component of the project that has not been altered is the gatehouse; the dam, power

[20] The 1991 Phase 1 archeological survey was re-filed with the Commission on January 24, 2020, online at https://elibrary.ferc.gov/eLibrary/filelist?accession_number=20200124-5100&optimized=false

[21] The 1996 CRMP states that "It was recommended that insofar as the sites are continuously inundated, they are not affected by normal project operations and the SHPO concurred" citing an August 3, 1992 letter from Nancy Muller to James Kearns. .

[22] Although Buck Island was inaccessible to Gengras and Bolian during their survey, they cited a report by Wight (1967) that claims Indian artifacts were found on Buck Island in 1827.

canal, and powerhouse have all been either altered substantially or replaced since they were built. Aside from its traditional association with the Village of Gorham, the survey failed to identify any significant historical associations with regard to the Gorham Project. The project is therefore recommended not eligible for the NRHP.

3.2.5.2 Environmental Effects

CRP does not propose any new construction, ground disturbing activities, or changes to project operation or maintenance. CRP does not anticipate erosion issues based on the continued operations of the project. CRP proposes to continue to implement the approved July 29, 1996, CRMP for the term of the new license.

The 1996 CRMP describes policies and procedures communicating internally and with the SHPO to ensure that any future actions would not adversely affect newly discovered resources or the Eddy Bridge and Logging Boom sites. Specifically, the 1996 CRMP defines routine maintenance activities that would not result in adverse effects on cultural resources (e.g., painting, mowing, resurfacing the dam, snow plowing, tree and brush trimming, resurfacing parking areas, and equipment and structure maintenance); stipulates that CRP will seek to amend the license if non-routine maintenance of the Eddy Bridge site and Logging Boom site would be required; and stipulates if known or suspected historic materials or human remains are found during work activities, CRP will stop work in the immediate vicinity of the finds, notify the SHPO, and take necessary steps to protect the site.

No recommendations were provided in response to the Commission's ready for environmental analysis notice.

Staff Analysis

For the reasons noted above the Gorham Project dam, powerhouse and other components are not eligible for listing on the National Register; therefore, continued project operation would not result in an adverse effect. However, the project inundates the Eddy Bridge and Logging Boom sites which are eligible for listing. While there currently are no planned activities that would result in adverse effects to these sites, future operational changes, repairs, or modifications to the project could adversely affect these sites.

While the 1996 CRMP contains measures to avoid, lessen, or mitigate for any adverse effects to historic properties during the term of any new license, it was developed as a requirement of the current license and does not conform to the current guidelines for the Historic Property Management Plans, as established by the Commission and the Advisory Council. For example, the CRMP identifies responsible entities for implementing the CRMP and consulting with the SHPO that are likely no longer present. Other issues include dated maps, consultation procedures, and survey information.

Developing an HPMP in consultation with the New Hampshire SHPO that includes the provisions in the current CRMP updated to conform to current standards for HPMPs, would ensure that the potential for unanticipated adverse effects on the inundated resources and any

other newly discovered properties would be protected. Executing a Programmatic Agreement requiring CRP to file a HPMP would fulfill the Commission's responsibilities under section 106.

3.3.6 Environmental Justice

In conducting NEPA review of proposed hydropower projects, the Commission follows Executive Order 12,898 and Executive Order 14,096, which direct federal agencies to identify, analyze, and address "disproportionate and adverse human health or environmental effects" of their actions on minority and low-income populations (i.e., environmental justice communities).[23] Executive Order 14,008 also directs agencies to develop "programs, policies, and activities to address the disproportionately high and adverse human health, environmental, climate-related and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts."[24] Environmental justice is "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies."[25] The term "environmental justice community" includes disadvantaged communities that have been historically marginalized and overburdened by pollution.[26] Commission staff used *Promising Practices for EJ Methodologies in NEPA Reviews* (*Promising Practices*) [27] which provides methodologies for conducting environmental justice analyses throughout the NEPA process for this project.

---

[23] Exec. Order No. 12,898, 59 Fed. Reg. 7629, 7629 (Feb. 11, 1994); Exec. Order No. 14,096, 88 Fed. Reg. 25251, 25253 (Apr. 21, 2023).

[24] Exec. Order No. 14,008, 86 Fed. Reg. 7619, 7629 (Jan. 27, 2021).

[25] EPA, *EJ 2020 Glossary* (July 31, 2023) https://www.epa.gov/system/files/documents/2024-02/ej-2020-glossary.pdf. Fair treatment means that no group of people should bear a disproportionate share of the negative environmental consequences from industrial, municipal, and commercial operations or the execution of federal, state, local, and tribal programs and policies. Fair treatment includes not only consideration of how burdens are distributed across all populations, but the distribution of benefits as well. *Id.* Meaningful involvement of potentially affected environmental justice community residents means: (1) people have an appropriate opportunity to participate in decisions about a proposed activity that may affect their environment and/or health; (2) the public's contributions can influence the regulatory agency's decision; (3) community concerns will be considered in the decision-making process; and (4) decision makers will seek out and facilitate the involvement of those potentially affected. *Id.*

[26] Environmental justice communities include, but may not be limited to minority populations, low-income populations, or indigenous peoples. *See* EPA, *EJ 2020 Glossary* (July 31, 2023) https://www.epa.gov/system/files/documents/2024-02/ej-2020-glossary.pdf.

[27] Federal Interagency Working Group on Environmental Justice & NEPA Committee, *Promising Practices for EJ Methodologies in NEPA Reviews* (Mar. 2016) (*Promising Practices*)

Additionally, consistent with EPA recommendations, Commission staff used EPA's Environmental Justice Screening and Mapping Tool (EJScreen) as an initial screening tool to better understand locations that require further review or additional information regarding minority and/or low-income populations; potential environmental quality issues; environmental and demographic indicators; and other important factors.[28]

3.3.6.1 Meaningful Engagement and Public Involvement

The Council on Environmental Quality's (CEQ) *Environmental Justice Guidance Under the National Environmental Policy Act* (CEQ Environmental Justice Guidance) [29] and *Promising Practices* recommend that federal agencies provide opportunities for effective community participation in the NEPA decision-making process by, identifying potential effects and mitigation measures in consultation with affected communities; improving accessibility of public meetings, crucial documents, and notices; and using adaptive approaches to overcome potential barriers to effective participation. In addition, Executive Order 13,985 and Executive Order 14,096, strongly encourage independent agencies to "consult with members of communities that have been historically underrepresented in the Federal government and underserved by, or subject to discrimination in, Federal policies and programs" [30] and "provide opportunities for the meaningful engagement of persons and communities with environmental justice concerns who are potentially affected by Federal activities." [31]

There have been opportunities for public involvement during the Commission's environmental review processes. The Commission's communication and involvement with the surrounding communities began on September 18, 2019, with the public notice of the pre-application document and issuance of the *Notice Soliciting Scoping Comments* which opened a 60-day scoping period to identify issues, concerns, and opportunities for enhancement or mitigation associated with the proposed action. Public scoping meetings were held October 22 and 23, 2019. We issued a *Notice of Application Accepted for Filing, Soliciting Motions to Intervene and Protests, Ready for Environmental Analysis, and Soliciting Comments, Recommendations, Terms and Conditions, and Prescriptions* on July 26, 2023, which established a 60-day comment period and intervention deadline. Finally, we issued a *Notice of Intent to*

[28] EPA recommends that screening tools, such as EJScreen, be used for a "screening-level" look and a useful first step in understanding or highlighting locations that may require further review.

[29] CEQ, *Environmental Justice: Guidance Under the National Environmental Policy Act* 4 (Dec. 1997) (CEQ's *Environmental Justice Guidance*) https://ceq.doe.gov/docs/ceq-regulations-and-guidance/regs/ej/justice.pdf.

[30] Exec. Order No. 13,985, 86 Fed. Reg. 7009, 7011 (Jan. 20. 2021).

[31] Exec. Order No. 14,096, 88, Fed. Reg. 25251, 25254 (Apr. 21, 2023).

Prepare an Environmental Assessment on October 12, 2023. Each of these notices were published in the Federal Register and local newspapers.

All documents that form the administrative record for this proceeding, with the exclusion of privileged or critical energy infrastructure information, are available to the public on FERC's e-library website (https://elibrary.ferc.gov/eLibrary/search). We recognize that not everyone has internet access or is able to file electronic comments. Anyone may comment about the project, either in writing or electronically. [32]

3.3.6.2 Identification of Environmental Justice Communities

According to CEQ's *Environmental Justice Guidance* and *Promising Practices*, minority populations are those groups that include: American Indian or Alaskan Native; Asian or Pacific Islander; Black, not of Hispanic origin; or Hispanic.[33] Following the recommendations set forth in *Promising Practices*, FERC uses the 50 percent and the meaningfully greater analysis methods to identify minority populations.

Using this methodology, minority populations are defined in this EA where either: (a) the aggregate minority population of the block groups in the affected area exceeds 50 percent; or (b) the aggregate minority population in the block group affected is 10 percent higher than the aggregate minority population percentage in the county. The guidance also directs low-income populations to be identified based on the annual statistical poverty thresholds from the U.S. Census Bureau. Using Promising Practices' low-income threshold criteria method, low-income populations are identified as block groups where the percent low-income population in the identified block group is equal to or greater than that of the county. Here, Commission staff selected Coos County, New Hampshire, in which the project action is located, as the comparable reference community to ensure that affected environmental justice communities are properly identified. A reference community may vary according to the characteristics of the particular project and the surrounding communities.

Table 6 identifies the minority populations by race and ethnicity and low-income populations within New Hampshire, the county affected by the relicense application (Coos County, New Hampshire), and U.S. census block groups[34] within the vicinity of the project site.

---

[32] The Office of Public Participation (OPP) provides members of the public, including environmental justice communities, landowners, Tribal citizens, and consumer advocates, with assistance in FERC proceedings—including navigating Commission processes and activities relating to the Project. For assistance with interventions, comments, requests for rehearing, or other filings, and for information about any applicable deadlines for such filings, members of the public are encouraged to contact OPP directly at 202-502-6595 or OPP@ferc.gov for further information.

[33] *See Promising Practices* at 21-25.

[34] Census block groups are statistical divisions of census tracts that generally contain between 600 and 3,000 people. U.S. Census Bureau. 2023. Glossary: Block Group. Available

For this project, staff chose a 1-mile radius around the project boundary (figure 3). Staff determined that a 1-mile radius is sufficient to encompass and address any potential impacts that may arise from the proposed action given the limited scope of the proposed relicensing, including the concentration of project-related effects within the project boundary. To ensure we are using the most recent available data, we used U.S. Census American Community Survey as the source for race and ethnicity data and poverty data at the census block group level.[35]

Within the study area, staff identified one census block group in which the population qualifies as environmental justice community because it met the threshold for both the low-income and minority population criteria.

3.3.6.3 Impacts on Environmental Justice Communities

Consistent with *Promising Practices*, Executive Order 12,898, and Executive Order 14,096, we reviewed the project to determine if its resulting impacts would be disproportionate and adverse on minority and low-income populations and also whether impacts would be significant.[36] *Promising Practices* provides that agencies can consider any of a number of conditions. In this determination and the presence of any of these factors could indicate a potential disproportionate and adverse impact. For this project, a disproportionate and adverse effect on an environmental justice community means the adverse effect is predominantly borne by such population.

Relevant considerations include the location; the natural and physical environment affected by project facilities; and the project's human health and environmental impacts, including associated social, economic, or cultural direct, indirect and cumulative impacts, on identified environmental justice communities.

As described in section 2.2, *CRP's Proposal,* CRP proposes to continue operating the project in a run-of-river mode. CRP does not propose any new construction or ground disturbing

---

online at: https://www.census.gov/programs-surveys/geography/about/glossary.html#par_textimage_4. Accessed February 2023.

[35] U.S. Census Bureau, American Community Survey 2022 ACS 5-Year Estimates Detailed Tables, File# B17017, *Poverty Status in the Past 12 Months by Household Type by Age of Householder*, https://data.census.gov/cedsci/table?q=B17017; File #B03002 *Hispanic or Latino Origin By Race*, https://data.census.gov/cedsci/table?q=b03002.

[36] *See Promising Practices* at 33 (stating that "an agency may determine that impacts are disproportionately high and adverse, but not significant within the meaning of NEPA" and in other circumstances "an agency may determine that an impact is both disproportionately high and adverse and significant within the meaning of NEPA"); *see also Promising Practices* at 45-46 (explaining that there are various approaches to determining whether an impact will cause a disproportionately high and adverse impact). We recognize that CEQ and EPA are in the process of updating their guidance regarding environmental justice and we will review and incorporate that anticipated guidance in our future analysis, as appropriate.

activities. No entity provided comments or recommendations regarding the effects of the project on environmental justice communities in response to the Commission's notice that the application was ready for environmental analysis.

3.3.6.4 Determination of Disproportionate and Adverse Impacts

Staff evaluated the effects of continued project operation on aquatic resources, terrestrial resources, threatened and endangered species, recreation, and cultural resources in sections 3.3.1 through 3.3.5 above. CRP does not propose any new construction, ground disturbing activities, or changes to project operation or maintenance. CRP's proposed continued project operation as a run-of-river facility would protect environmental resources, including water supply, water quality, recreation, and fisheries. CRP's proposal to continue providing a minimum flow of 200 cfs or inflow, whichever is less, to the bypassed reach of the Gorham Project would protect aquatic resources. Therefore, we conclude that licensing the Gorham Hydroelectric Project would not adversely affect residents of the identified environmental justice community. In consideration of the limited scope of the proposed project, and the staff-recommended environmental protection and enhancement measures noted above, the project would not result in a disproportionate and adverse impact on environmental justice community present within the project area.

4.0 DEVELOPMENTAL ANALYSIS

In this section, we look at the project's use of the Androscoggin River for hydropower generation to see what effect various proposed or recommended environmental measures would have on the cost to operate and maintain the project and on the project's power generation. Under the Commission's approach to evaluating the economics of hydropower projects, as articulated in *Mead Corp*.,[37] the Commission compares the current cost to produce project power to an estimate of the cost to provide the same amount of energy and capacity[38] for the region using the most likely alternative source of power (cost of alternative power). In keeping with the policy described in *Mead Corp.*, our economic analysis is based on current electric power cost conditions and does not anticipate or estimate changes in fuel costs that could occur during a project's license term.

For each of the licensing alternatives, our analysis includes an estimate of: (1) the annualized cost of providing the individual measures considered in the EA; (2) the cost of the most likely alternative source of project power; (3) the total annual project cost (i.e., for construction, operation, maintenance, and environmental measures); and (4) the difference

[37] *See Mead Corp.*, 72 FERC ¶ 61,027 (July 13, 1995). In most cases, electricity from hydropower would displace some form of fossil-fueled generation, in which fuel cost is the largest component of the cost of electricity production.

[38] We use the term "Capacity benefit" to describe the benefit a project receives for providing capacity to the grid, which may be in the form of a dependable capacity credit or credit for monthly capacity provided.

between the cost of the current alternative source of project power and the total annual project cost. Power and developmental costs for the Gorham Project can be found in Table 6. A comparison of alternatives can be found in Appendix E.

If the difference between the cost to produce an equivalent amount of power from an alternative source and the total annual project cost is positive, the project produces power at a cost less than the cost of producing power from the most likely least-cost source of alternative power. If the difference between the alternative source of power's annual cost and the total annual project cost is negative, the project costs more to produce power than the cost to produce an equivalent amount of power from the most likely least-cost source of alternative power. This estimate helps support an informed decision concerning what is in the public interest with respect to a proposed license. However, project economics is only one of many public interest factors the Commission considers in determining whether, and under what conditions, to issue a license.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 COMPREHENSIVE DEVELOPMENT AND RECOMMENDED ALTERNATIVE

Sections 4(e) and 10(a)(1) of the FPA require the Commission to give equal consideration to the power development purposes and to the purposes of energy conservation; the protection, mitigation of damage to, and enhancement of fish and wildlife; the protection of recreational opportunities; and the preservation of other aspects of environmental quality. Any license issued shall be such as in the Commission's judgment will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for all beneficial public uses. This section contains the basis for, and a summary of, our recommendations for licensing the Gorham Project. We weigh the costs and benefits of our recommended alternative against other proposed measures.

Based on our independent review of agency and public comments filed on this project and our evaluation of the environmental and economic effects of the proposed action and its alternatives, we selected the staff alternative as the preferred alternative for the Gorham Project. We recommend this alternative because: (1) issuing a new license for the project would allow CRP to operate the project as a beneficial and dependable source of electric energy; (2) generation from the Gorham Project, with an installed electric capacity of 2.15-MW, comes from a renewable resource that does not contribute to atmospheric pollution; (3) the public benefits of this alternative would exceed those of the no-action alternative; and (4) the recommended measures would protect and enhance aquatic and cultural resources and threatened and endangered species at the project.

Below, we make recommendations as to which environmental measures proposed by CRP or recommended by agencies or other entities, should be included in any license issued for the project. In addition to CRP's proposed environmental measures listed below, we recommend additional environmental measures be included in any new license issued for the project.

5.1.1 Measures Proposed by CRP

Based on our environmental analysis of CRP's proposal, as discussed in section 3.0, *Environmental Analysis*, and the costs presented in section 4.0, *Developmental Analysis*, we conclude the following operation and environmental measures proposed by CRP would protect and enhance environmental resources and would be worth the cost. Therefore, we recommend including the following measures in any new license issued for the Gorham Project:

- Continue to operate the project as a run-of-river facility by maintaining the impoundment level within 2 inches of the normal full pond level of 772.53 feet such that at any given point in time, all outflow from the project approximates all inflow to the project.
- Continue to provide a minimum flow of 200 cfs or inflow, whichever is less, to the project's bypassed reach.
- Implement an updated Operations Compliance Plan to ensure compliance with a new FERC license.
- Continue to operate and maintain the project's existing recreation facilities: (1) a canoe portage, take-out and put-in with directional signage; (2) an informational kiosk located on the north shore of the impoundment containing maps and other recreation information; (3) informational signage located at the Route 2 entrance to the project and on Hogan Road; and (4) an approximately 20-foot by 60-foot gravel parking area with space for six vehicles and one designated ADA parking space located off Route 2.
- Continue to implement the July 29, 1996, Cultural Resources Management Plan (CRMP) to protect historic resources.

5.1.2 Additional Measures Recommended by Staff

In addition to CRP's proposed measures noted above, we recommend including the following additions or modifications:

- Avoid removing and trimming trees equal to greater than 3 inches dbh from April 15 through October 31 to protect the northern long-eared bat and tri-colored bat, unless the trees represent a public safety hazard.
- Develop a Historic Properties Management Plan (HPMP), implemented by a programmatic agreement (PA), within one year of license issuance to provide for the management of historic properties that are eligible for or listed on the National Register of Historic Places (National Register) within the project's area of potential effect (APE).

In Appendix F, we discuss the basis for recommending the additions or modifications to CRP's proposal.

5.2 UNAVOIDABLE ADVERSE EFFECTS

Continued project operation would continue to impede passage of some fish species and result in some unavoidable injury or mortality to fish species. Impoundment fluctuations associated with project operation could affect near-shore aquatic habitat; however, CRP's

proposal to continue to operate in a run-of-river mode with limited impoundment fluctuations would result in infrequent and minimal disturbances to aquatic and riparian habitat.

5.3 CONSISTENCY WITH COMPREHENSIVE PLANS

Section 10(a)(2)(A) of the FPA, 16 United States Code § 803(a)(2)(A), requires the Commission to consider the extent to which a project is consistent with federal or state comprehensive plans for improving, developing, or conserving a waterway or waterways affected by the project. We reviewed 6 comprehensive plans that are applicable to the Gorham Project, located in New Hampshire which can be found in Appendix H. No inconsistencies were found.

6.0 FINDING OF NO SIGNIFICANT IMPACT

If the Gorham Project is relicensed with our recommended measures, the project would operate while providing enhancements and protective measures for aquatic, recreational, and cultural resources in the project area.

Based on our independent analysis, issuance of a new license for the Gorham Project with additional staff-recommended measures, would not constitute a major federal action significantly affecting the quality of the human environment.

7.0 LITERATURE CITED

The literature cited is in Appendix I.

8.0 LIST OF PREPARERS

The list of preparers of this EA is in Appendix J.

APPENDIX A- STATUTORY AND REGULATORY REQUIREMENTS

Federal Power Act

Section 18 Fishway Prescription

Section 18 of the FPA, 16 U.S.C. § 811, states that the Commission is to require construction, operation, and maintenance by a licensee of such fishways as may be prescribed by the Secretaries of the U.S. Department of Commerce (Commerce) or the U.S. Department of the Interior (Interior). Interior, by letter filed with the Commission on September 11, 2023, requests that a reservation of authority to prescribe fishways under section 18 be included in any license issued for the project.

Section 10(j) Recommendations

Under section 10(j) of the FPA, 16 U.S.C. § 803(j), each hydroelectric license issued by the Commission must include conditions based on recommendations provided by federal and state fish and wildlife agencies for the protection, mitigation, or enhancement of fish and wildlife resources affected by the project. The Commission is required to include these conditions unless it determines that they are inconsistent with the purposes and requirements of the FPA or other applicable law. Before rejecting or modifying an agency recommendation, the Commission is required to attempt to resolve any such inconsistency with the agency, giving due weight to the recommendations, expertise, and statutory responsibilities of such agency. No agencies filed 10(j) recommendations for the Gorham Project.

Clean Water Act

Under section 401(a)(1) of the Clean Water Act, 33 U.S.C. § 1341(a)(1), a license applicant must obtain either a water quality certification (certification) from the appropriate state pollution control agency verifying that any discharge from a project would comply with applicable provisions of the Clean Water Act, or a waiver of the certification by the appropriate state agency. The failure to act on a request for certification within a reasonable period of time, not to exceed one year, after receipt of the request constitutes a waiver.

On September 22, 2023, CRP applied to the New Hampshire Department of Environmental Services (New Hampshire DES) for certification for the Gorham Project. New Hampshire DES received the application on the same day.[39] New Hampshire DES filed it certification on September 19, 2024.

Endangered Species Act

Section 7 of the Endangered Species Act (ESA), 16 U.S.C. § 1536, requires federal agencies to ensure that their actions are not likely to jeopardize the continued existence of any

[39] CRP filed a copy of the receipt of delivery of the application to New Hampshire DES on September 22, 2023.

endangered or threatened species or result in the destruction or adverse modification of the critical habitat of such species. According to the IPaC database, the federally threatened northern long-eared bat (NLEB; *Myotis septentrionalis*), the federally threatened Canada lynx (*Lynx canadensis*), and the candidate species monarch butterfly (*Danaus plexippus*) could occur in vicinity of the project. While not included in the IPaC list, the tri-colored bat (*Perimyotis subflavus*) may also be present. On September 13, 2022, FWS proposed listing the tri-colored bat as endangered. As such, we include a discussion of the tri-colored bat and any potential project effects in this EA.

Our analysis of project impacts on the NLEB, tri-colored bat, Canada lynx, and monarch butterfly is presented in Appendix D, *Biological Assessment*. Avoiding the removal and trimming of trees greater than 3 inches dbh from April 15 through October 31 would protect the NLEB, the tri-colored bat, and their newly born pups. We conclude that licensing the project under the staff alternative, would have no effect on the Canada lynx and no effect on the monarch butterfly. With no cutting or trimming of trees greater than 3 inches dbh from April 15 through October 31, we conclude that relicensing the project may affect, but is not likely to adversely affect the NLEB, and is not likely to jeopardize the continued existence of the tri-colored bat. No further action is required under the ESA after making a determination of no effect or not likely to jeopardize. We requested concurrence from FWS with our determination of not likely to adversely affect NLEB in a letter issued April 8, 2024. On October 1, 2024, FWS filed a letter with the Commission concurring with our determination.

Coastal Zone Management Act

Under section 307(c)(3)(A) of the Coastal Zone Management Act (CZMA), 16 U.S.C. §1456(3)(A), the Commission cannot issue a license for a project within or affecting a state's coastal zone unless the state's coastal zone management agency concurs with the license applicant's certification of consistency with the state's CZMA program, or the agency's concurrence is conclusively presumed by its failure to act within 6 months of its receipt of the applicant's certification.

On January 18, 2022, CRP requested confirmation from the New Hampshire Coastal Program (NHCP) that the Gorham Project is not included within the jurisdiction of the NHCP. NHCP[40] confirmed that the project is outside the New Hampshire coastal zone and the relicensing of the Gorham Project is not subject to CZMA Federal consistency review by the New Hampshire Coastal Program.

National Historic Preservation Act

Section 106 of the National Historic Preservation Act (NHPA),[41] requires that a federal agency "take into account" how its undertakings could affect historic properties. Historic properties are districts, sites, buildings, structures, traditional cultural properties, and objects

[40] See email from NHCP filed with the Commission on March 15, 2024.

[41] 54 U.S.C. § 306108.

significant in American history, architecture, engineering, and culture that are eligible for inclusion in the National Register of Historic Places (National Register).

Commission staff designated CRP as its non-federal representative for the purposes of conducting section 106 consultation under the NHPA on September 18, 2019. Pursuant to section 106, and as the Commission's designated non-federal representative, CRP initiated consultation with the New Hampshire State Historic Preservation Office (SHPO) to assess potential adverse effects on historic properties within the project's area of potential effects (APE). The Gorham Project APE[42] includes lands enclosed within the current project boundary.

The Eddy Bridge and Logging Boom sites are currently the only two NRHP-eligible historic properties at the project. These sites are inundated by the project impoundment and could be affected by activities outside normal operation and maintenance.

The current CRMP is dated and no longer contains procedures that conform to the current guidelines for the Historic Property Management Plans, as established by the Commission and the Advisory Council. [43] For example, the CRMP identifies responsible entities for implementing the CRMP and consulting with the SHPO that are likely no longer present. Other issues include dated maps, consultation procedures, and survey information. Updating the CRMP to meet current standards would ensure that appropriate measures are in place to timely address unavoidable and unanticipated adverse effects of project operation and maintenance on cultural resources.

To meet the requirements of section 106, the Commission intends to execute a Programmatic Agreement (PA) with the New Hampshire SHPO that requires CRP to develop an HPMP, in consultation with the SHPO, that includes the provisions in the current CRMP updated to conform to current standards for HPMPs as stipulated in the Commission's current guidelines for the development of Historic Property Management Plans. Implementing the provisions of the PA and revised HPMP would protect cultural resources and fulfill the Commission's responsibilities under section 106. A draft PA was issued for review and comment on April 22, 2024. On May 7, 2024, the New Hampshire SHPO filed a letter to the record stating they reviewed the draft PA and did not have any comments. On May 9, 2024, the Advisory Council on Historic Preservation (ACHP) filed a letter stating that they have completed their review of the project and have determined that their participation in the consultation is not needed. On May 22, 2024, CRP filed a comment letter requesting the final PA identify the licensee for the project as CRP NH Gorham, LLC rather than as Central Rivers Power, LLC. To date, no other comments have been filed on the draft PA. A final PA will be issued following the issuance of the final EA.

---

[42] According to the license application, CRP consulted the SHPO for all surveyed structures within the area of potential effect (APE); therefore, we assume SHPO concurrence on the APE.

[43] See Issuance of Guidelines for Historic Properties Management Plans (July, 2020), https://www.ferc.gov/sites/default/files/2020-07/hpmp.pdf

Executive Orders 12898 and 14008

The Commission follows Executive Order 12898, which directs federal agencies to identify and address "disproportionately high and adverse human health or environmental effects" of their actions on minority and low-income populations (i.e., environmental justice communities).[44] Executive Order 14008 also directs agencies to develop "programs, policies, and activities to address the disproportionately high and adverse human health, environmental, climate-related and other cumulative impacts on disadvantaged communities, as well as the accompanying economic challenges of such impacts."[45] Environmental justice is "the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies" (EPA, 2021b).

Staff identified one census block group that qualify as environmental justice community within a 1-mile radius of the project boundary and considered how the community may be affected by continued project operation or the proposed and recommended environmental measures. Our analysis of the project's impacts on the community is presented in section 3.3.6, *Environmental Justice*. We conclude that relicensing the project, as proposed with staff's recommended modifications, would not result in disproportionate and adverse effects on the identified environmental justice population.

[44] Exec. Order No. 12,898, 59 Fed. Reg. 7,629 (Feb. 16, 1994). While the Commission is not one of the specified agencies in Executive Order 12898, the Commission nonetheless addresses environmental justice in its analysis, in accordance with our statutory duties.

[45] Exec. Order No. 14,008, 86 Fed. Reg. 7,619 (Feb. 1, 2021). The term "environmental justice community" includes disadvantaged communities that have been historically marginalized and overburdened by pollution. Id. § 219, 86 Fed. Reg. 7,619, 7,629. The term also includes, but may not be limited to, minority populations, low-income populations, or indigenous peoples (EPA, 2021a).

APPENDIX B- ALTERNATIVES CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS

Issuing a Non-power License

A non-power license is a temporary license that the Commission would terminate when it determines that another governmental agency will assume regulatory authority and supervision over the lands and facilities covered by the non-power license. At this time, no agency has suggested a willingness or ability to take over the project. No party has sought a non-power license, and we have no basis for concluding that the Gorham Project should no longer be used to produce power.

Federal Government Takeover

Federal takeover and operation of the Gorham Project would require congressional approval. While that fact alone would not preclude further consideration of this alternative, there is currently no evidence to indicate that federal takeover should be recommended to Congress. No party has suggested that federal takeover would be appropriate, and no federal agency has expressed interest in operating the project.

Project Retirement

As the Commission has previously held, decommissioning is not a reasonable alternative to relicensing in most cases.[46] Decommissioning can be accomplished in different ways depending on the project, its environment, and the particular resource needs.[47] For these reasons, the Commission does not speculate about possible decommissioning measures at the time of relicensing, but rather waits until an applicant actually proposes to decommission a project, or a participant in a relicensing proceeding demonstrates that there are serious resource concerns that cannot be addressed with appropriate license measures and that make decommissioning a reasonable alternative.[48]

---

[46] *See, e.g., Eagle Crest Energy Co*., 153 FERC ¶ 61,058, at P 67 (2015); *Public Utility District No. 1 of Pend Oreille County*, 112 FERC ¶ 61,055, at P 82 (2005); *Midwest Hydro, Inc*., 111 FERC ¶ 61,327, at PP 35-38 (2005).

[47] In the event that the Commission denies relicensing a project or a licensee decides to surrender an existing project, the Commission must approve a surrender "upon such conditions with respect to the disposition of such works as may be determined by the Commission." 18 C.F.R. § 6.2. This can include simply shutting down the power operations, removing all or parts of the project (including the dam), or restoring the site to its pre-project condition.

[48] *See generally Project Decommissioning at Relicensing*; Policy Statement, FERC Stats. & Regs., Regulations Preambles (1991-1996), ¶ 31,011 (1994); *see also City of Tacoma, Washington,* 110 FERC ¶ 61,140 (2005) (finding that unless and until the Commission has a

CRP does not propose decommissioning, nor does the record to date demonstrate there are serious resource concerns that cannot be mitigated if the project is relicensed; as such, there is no reason, at this time, to include decommissioning as a reasonable alternative to be evaluated and studied as part of staff's NEPA analysis.

specific decommissioning proposal, any further environmental analysis of the effects of project decommissioning would be both premature and speculative).

APPENDIX C- FIGURES AND TABLES

Table 1. Monthly minimum, maximum, and average flow, USGS Gage # 01054000 Androscoggin River near Gorham, New Hampshire (January 1, 1991, to December 31, 2020). (source: license application).

Month	Minimum (cfs)	Maximum (cfs)	Average (cfs)
January	1,250	6,300	2,641
February	1,270	6,950	2,769
March	1,260	14,200	3,064
April	1,270	19,900	4,751
May	1,380	16,200	4,118
June	1,140	12,800	2,862
July	944	10,300	2,309
August	1,090	10,000	1,957
September	780	9,730	1,840
October	1,020	15,000	2,290
November	1,140	10,000	2,552
December	1,160	9,790	2,528
Annual	**780**	**19,900**	**2,805**

Table 2. Water Quality Criteria for Class B Waters in New Hampshire (source: application).

Parameter	Criteria
Dissolved Oxygen (DO)	Instantaneous minimum concentration of 5 mg/L At least 75% saturation (daily average)[1]
Nutrients	Shall contain no phosphorus or nitrogen in such concentrations that would impair any existing or designated uses, unless naturally occurring
Total Phosphorous	For the protection of aquatic life: < 8 µg/L in oligotrophic waters ≤ 12 µg/L in mesotrophic waters ≤ 28 µg/L in eutrophic waters (median based on a least 5 independent samples collected between May 24 and September 15)
Chlorophyll-a	≤ 15 µg/L for protection of recreational uses in freshwater. For the protection of aquatic life: < 3 µg/L in oligotrophic waters ≤ 5 µg/L in mesotrophic waters ≤ 11 µg/L in eutrophic waters (median based on a least 5 independent samples collected between May 24 and September 15).
pH	6.5 to 8
Temperature	Any stream temperature increase associated

	with the discharge of treated sewage, waste or cooling water, water diversions, or releases shall not be such as to appreciably interfere with the uses assigned to this class

[1] Unless naturally occurring or subject to (a), above, surface waters within the top 25 percent of depth of thermally unstratified lakes, ponds, impoundments, and reservoirs or within the epilimnion shall contain a dissolved oxygen content of at least 75 percent saturation, based on a daily average and an instantaneous minimum dissolved oxygen content of at least 5 mg/l. Unless naturally occurring, the dissolved oxygen content below those depths shall be consistent with that necessary to maintain and protect existing and designated uses.

Table 3. DO (mg/L and percent saturation), daily average DO percent saturation, water temperature, and pH statistics at the Gorham Project (source: application).

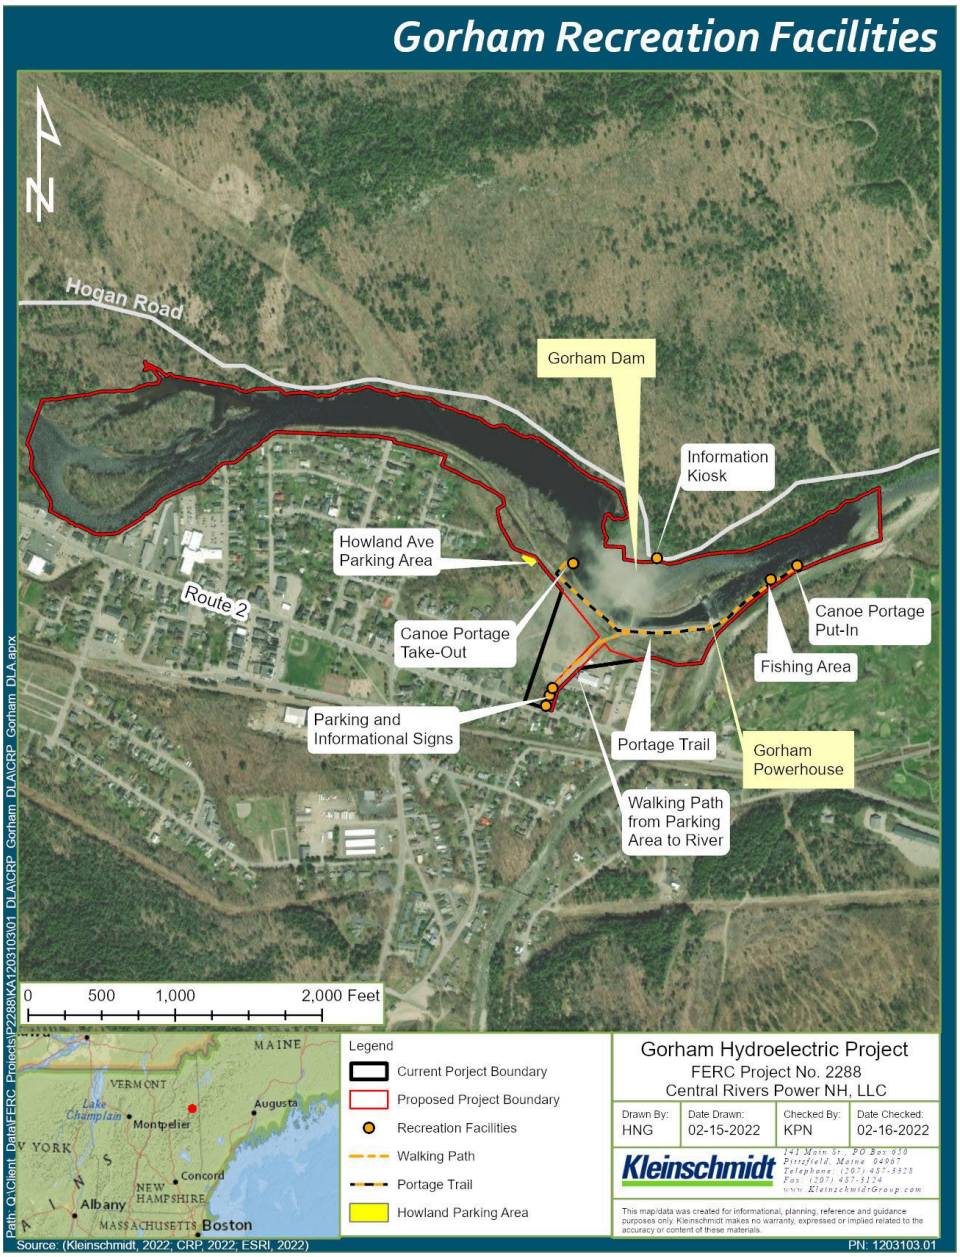

Figure 2. Gorham Project recreation facilities (source: Recreation Study Report filed 4/12/23).

Table 5. Cost of environmental measures considered in assessing the environmental effects of operating the Gorham Project (source: CRP and staff).

Enhancement / Mitigation Measure	Entity	Capital Cost[a] (2024$)	Annual Cost[a] (2024$)	Levelized Annual Cost[b] (2024$)
Aquatic Resources				
1. Continue to operate the project as a run-of-river facility.	CRP Staff	$0	$0[c]	$0
2. Continue to provide minimum flows of 200 cfs or inflow, whichever is less, to the bypassed reach of the Gorham Project.	CRP Staff	$0	$0[d]	$0
3. Develop and implement an updated Operations Compliance Plan.	CFP Staff	$5,000[c,e]	$2,500[c,e]	$2,944
Threatened and Endangered Species				
4. Avoid trimming and removal of trees with diameters that are equal to or greater than 3 inches at breast height within the project boundary between April 15 and October 31 to protect federally-listed bats.	Staff	$0	$0	$0
Recreation Resources				
5. Maintain and operate the existing recreation facilities.	CRP Staff	$0[e]	$10,000[c,e]	$10,000

Enhancement / Mitigation Measure	Entity	Capital Cost[a] (2024$)	Annual Cost[a] (2024$)	Levelized Annual Cost[b] (2024$)
Cultural Resources				
6. Continue to implement the existing 1996 Cultural Resources Management Plan (CRMP).	CRP	$0[e]	$2,000[c,e]	$2,000
7. Develop a HPMP within one year of license issuance.	Staff	$5,000[e]	$2,000[e]	$2,444

[a] Unless otherwise noted, all cost estimates are from CRP. Commission staff reviewed these costs and determined that they are reasonable estimates.

[b] All capital and annual costs are converted to equal costs over a 30-year period to give a uniform basis for comparison.

[c] Cost included in O&M cost.

[d] Under current operation, CRP provides a minimum bypassed reach flow of 200 cfs or inflow, whichever is less, which decreases electricity production by 59 MWh per year. Using an energy cost of $71.42/MWh from Table 7 as a proxy for the value of lost generation, 59 MWh of lost generation would be valued at a lost opportunity cost of $4,214/year.

[e] Cost estimated by staff.

APPENDIX D- BIOLOGICAL ASSESSMENT

Affected Environment

The FWS Information for Planning and Consultation (IPaC) database indicates that the threatened Canada lynx, the endangered northern long-eared bat, the threatened tri-color bat, and the candidate monarch butterfly have the potential to occur within the project boundary.[49] There are no proposed or designated critical habitats in the project area.

Northern Long-eared Bat

The northern long-eared bat (NLEB) was listed by the FWS as threatened on May 4, 2015 (FWS, 2015). In January 2016, the FWS finalized the ESA section 4(d) rule for this species, which focuses on preventing effects on bats in hibernacula associated with the spread of white-nose syndrome[50] and effects of tree removal on roosting bats or maternity colonies (FWS, 2016a). As part of the 4(d) rule, take incidental to certain activities conducted in accordance with the following habitat conservation measures, as applicable, would not be prohibited: (1) occurs more than 0.25-mile from a known, occupied hibernacula; (2) avoids cutting or destroying known, occupied maternity roost trees during the pup season (June 1 – July 31);[51] and (3) avoids cutting or destroying any tree within a 150-foot radius of a known, occupied maternity tree during the pup season. On January 5, 2016, FWS developed an optional streamlined consultation framework that allows federal agencies to rely on a programmatic biological opinion on FWS's final 4(d) rule to fulfill section 7(a)(2) consultation requirements for northern long-eared bat (FWS, 2016b).

On November 30, 2022, FWS reclassified the NLEB from a threatened species to an endangered species, effective January 30, 2023.[52] FWS extended the effective date of the final reclassification by 60 days, from January 30, 2023, to March 31, 2023.[53] The final rule removes the 4(d) rule for this species, because 4(d) rules apply only to species listed as threatened species under the ESA. In March 2023, FWS released a new range-wide NLEB determination key (Dkey), available through the IPaC website, to streamline the review of routine, predictable

---

[49] *See* Interior's IPaC database (https://ipac.ecosphere.fws.gov), last accessed by staff on February 28, 2024.

[50] A hibernaculum is where a bat hibernates over the winter, such as in a cave. White-nose syndrome is a fungal infection that agitates hibernating bats, causing them to rouse prematurely and burn fat supplies. Mortality results from starvation or, in some cases, exposure.

[51] Pup season refers to the period when bats birth their young.

[52] 87 Fed. Reg. 73,488 (November 30, 2022).

[53] 88 Fed. Reg. 4908-4910 (January 26, 2023).

projects and receive automatic verification or concurrence for some actions (FWS, 2023b). This Dkey replaces the previous key that was based on the 4(d) rule biological opinion.

Traditional ranges for NLEB include most of the central and eastern U.S., as well as the southern and central provinces of Canada, coinciding with the greatest abundance of forested areas. NLEB, whose habitat includes large tracts of mature, upland forests, typically feeds on moths, flies, and other insects. These bats are flexible in selecting roost sites, choosing roost trees that provide cavities and crevices, and trees with a diameter of 3 inches or greater at breast height.[54] Human-made structures, such as buildings, barns, bridges, and bat houses can be considered potential summer habitat. However, trees found in highly developed urban areas (e.g., street trees, downtown areas) are unlikely to be suitable NLEB habitat (FWS, 2014). NLEB are generally active from April through October (FWS, 2015, FWS, 2016c), and hibernate over the winter season. Winter hibernation typically occurs in caves and areas around them, and hibernacula can also be used for fall-swarming[55] and spring-staging.[56]

The project is located within the white-nose syndrome buffer zone for NLEB,[57] but no critical habitat has been designated for the species. Although there is no documentation of NLEB use of habitat at or near the project, forests near the project boundary may provide suitable habitat for NLEB summer roosting and foraging activities.

Tricolored Bat

FWS proposed on September 14, 2022, to list the tricolored bat as endangered,[58] based upon the range-wide impacts of white-nose syndrome which have caused estimated declines of more than 90 percent in affected colonies. No critical habitat is being designated because current or threatened destruction, modification, or curtailment of the species' habitat or range is not having large range wide effects on the species.

---

[54] Diameter at breast height refers to the tree diameter as measured about 4 to 4.5 feet above the ground.

[55] Fall-swarming fills the time between summer and winter hibernation. The purpose of swarming behavior may include: introduction of juveniles to potential hibernacula; copulation; and gathering at stop-over sites on migratory pathways between summer and winter regions.

[56] Spring-staging is the time period between winter hibernation and migration to summer habitat. During this time, bats begin to gradually emerge from hibernation and exit the hibernacula to feed, but re-enter the same or alternative hibernacula to resume daily bouts of torpor (i.e., a state of mental or physical inactivity).

[57] The white-nose syndrome buffer zone encompasses counties within 150 miles of a U.S. county or Canadian district in which white-nose syndrome or the fungus that causes white-nose syndrome is known to have infected bat hibernacula.

[58] 87 Fed. Reg. 56381 (Sep.14, 2022).

Tricolored bats are known to occur in 39 states, including all of the central and eastern United States.[59]

Male and female tricolored bats converge at cave and mine entrances between mid-August and mid-October to swarm and mate. During the winter, tricolored bats hibernate in caves and mines, although in the southern U.S., where caves are sparse, tricolored bats often hibernate in road-associated culverts and sometimes tree cavities and abandoned water wells.

During the spring, summer, and fall (i.e., non-hibernating seasons), tricolored bats disperse and primarily roost among live and dead leaf clusters of live or recently dead deciduous hardwood trees (FWS, 2021b). Female tricolored bats exhibit high site fidelity, returning year after year to the same summer roosting locations. Female tricolored bats form maternity colonies and switch roost trees regularly (e.g., between 1.2 days and 7 days at roost trees in Indiana). Females typically give birth to two young between May and July. Limited reproductive potential severely limits the ability of bat populations to respond quickly to perturbations. Upland forests near the project boundary contain suitable habitat for tricolored bat summer roosting and foraging activities.

Canada Lynx

The Canada lynx was listed as a threatened species under the ESA on March 24, 2000, with its critical habitat and a boundary revision of a distinct population segment listed on October 14, 2014.[60] All critical habitat within New England is in northern Maine, none of which is near the project in New Hampshire. According to the species listing, only 2 reports of lynx occurred in New Hampshire in the 1990s. Lynx are adapted to undisturbed higher elevation boreal forest with deep snow in which it specializes on predating snowshoe hare, none of which exist near the project.

Monarch Butterfly

The monarch butterfly was listed as a candidate species under the ESA on December 17, 2020.[61] The monarch butterfly exclusively uses milkweed (*Asclepias* spp.) as its larval host plant. Adults drink nectar from milkweed and other species' flowers, while trees and shrubs are used for shade and roosting. Monarchs are not known to overwinter near the project area. Common milkweed is not generally found at higher elevation areas within New Hampshire and is unlikely to be present in plant communities near the project.

Environmental Effects

The following discussion addresses environmental effects on threatened and endangered species that would result from relicensing the project under the Staff Alternative. This alternative includes relicensing the project with all staff recommended environmental measures.

No entity has proposed any measures for the protection of Canada lynx or monarch butterfly. Staff are proposing a time of year restriction for tree cutting to protect bat species.

Our Analysis

Northern Long-eared Bat

The applicant is not proposing any large-scale land clearing, but potential maintenance activities with the project and along the transmission line right of way during the term of a new license may require periodic tree cutting and vegetation management. In the absence of protocol-level surveys indicating the NLEB is not present in the project area, we assume the species may be present and could be adversely affected by tree cutting during the bats' active summer period. Placing seasonal limits on planned tree-cutting activity for trees that are equal to or greater than 3 inches at breast height (dbh) would protect NLEB and their newly born pups during their active season at the project. It is unknown whether there are or would be any live or dead trees greater than 3 inches dbh that have exfoliating bark, cracks, crevices and/or cavities that could be subject to removal or trimming during future maintenance activities. Regardless, given the small area where such activities may take place (less than 0.1 acres), the effect of the removing or trimming of any such trees would be minimal and would not significantly impair an essential behavior pattern such that it is likely to result in the death or injury of NLEB if it is conducted during the hibernation period.[62]

The FWS states that active season dates for NLEB in New Hampshire are April 15 through October 31.[63] No surveys for maternity roosts have been conducted in the 1.5-mile vicinity of the project, but the restriction on cutting non-hazardous trees equal to or greater than 3 inches dbh between April 15 and October 31 would protect the northern long-eared bat in a manner consistent with section 7 of the ESA. Therefore, we recommend that removing and

---

[62] Endangered and Threatened Wildlife and Plants: Endangered Species Status for northern Long-eared Bat Final Rule 87 FR No. 229 (November 30, 2022). The following actions are unlikely to result in a violation of section 9, if these activities are carried out in accordance with existing regulations and permit requirements; this list is not comprehensive. (2) Insignificant amounts of suitable forested/wooded habitat removal provided it occurs during the hibernation period and the modification of habitat does not significantly impair an essential behavior pattern such that it is likely to result in the actual killing or injury of northern long-eared bats after hibernation.

[63] FWS. 2023. Available at: https://www.fws.gov/sites/default/files/documents/Inactive%20Season%20Dates%20for%20Areas%20Outside%20of%20Swarming%20and%20Staging%20Areas_0.pdf

trimming trees equal to or greater than 3 inches dbh should occur only between November 1 and April 14, unless the trees pose an imminent public safety hazard. Based on these conditions, we conclude that the project may affect, but is not likely to adversely NLEB.

Tricolored Bat

Project maintenance activities that may affect the tricolored bat are the same as those noted above for the NLEB. Project maintenance is not expected to require the removal of any trees that could affect the bat or its habitat but could require tree trimming that could remove leaf clusters that provide roosting habitat. Avoiding trimming and removal of trees greater than 3 inches dbh within the project boundary from April 15 through October 31 to protect NLEB would also avoid cutting or destroying any potential maternity roost trees that may be occupied by tricolored bats during the tricolored bat pup season, which generally overlaps with that of NLEB. Therefore, we conclude that relicensing the project with tree-cutting restrictions from April 15 through October 31 is not likely to jeopardize the continued existence of the tricolored bat.

Canada Lynx

Canada lynx are not known, nor are they expected, to occur in the project area. There is little suitable habitat for the lynx nearby, and its main prey species, snowshoe hare, is also unlikely to occur. Lynx may also be functionally extirpated from the state of New Hampshire. Because lynx are extremely reclusive and avoid developed areas such as the project, we do not expect them to even occur as a possible transient and conclude the project will have no effect on this species.

Monarch Butterfly

Current maintenance activities at the project that could affect monarch butterflies include minor clearing and trimming of brush and other vegetation management, but there is no information to suggest that these activities would potentially remove or degrade monarch butterfly habitat. Therefore, any project effects to the monarch butterfly and its habitat would likely be minimal, and continued operation of the project will have no effect and is not likely to jeopardize the continued existence of the species.

APPENDIX E- POWER AND DEVELOPMENT BENEFITS OF THE PROJECT

POWER AND DEVELOPMENTAL BENEFITS OF THE PROJECTS

Table 5 in Appendix C summarizes the assumptions and economic information used in the analysis. Most of this information is provided by the applicant in its license application. Some is developed by Commission staff, as noted below. Cost items common to all alternatives include taxes and insurance; estimated capital investment required to develop the project or major modifications for relicensing; licensing costs; normal operation and maintenance cost; and Commission fees. All costs are adjusted to current year dollars.

Table 6. Parameters for economic analysis of the project (Source: license application; staff).

Parameter	Value
Installed Capacity	2.15 MW
Average annual generation (under no action alternative)	10,368 MWh
Period of analysis	30 years
Federal income tax rate	Included in the O&M cost
Local Tax Rate	Included in the O&M cost
Insurance	Included in the O&M cost
Interest rate	8%
Net Investment	$3,678,076
Application cost	$ 312,000
Operation and maintenance[a]	$339,482/year
Estimated Commission annual charges[b]	$7,000
Cost of Alternative Power (2022)[c]	
1) Energy cost (2022)	$71.42/MWh
2) Dependable Capacity Cost (2022)	$179.08/kw-year

[a] CRP's estimate of the project's operation and maintenance cost includes insurance, interim replacements, and administrative and general expenses.

[b] The Commission collects an annual administration charge for all licensed projects which is based on the authorized installed capacity of the project.

[c] The alternative source of power's cost is based on the current cost of providing the same amount of generation and capacity benefit from a natural gas-fired combined cycle plant, as reported by the most recent publication of The U.S. Energy Information Administration (EIA), Annual Energy Outlook. This analysis is based on The U.S. Energy Information Administration (EIA), Annual Energy Outlook 2023, for the Division 1, New England Region. The alternative

source of power's cost is reported in Table 7 and is a combination of the cost of energy and capacity benefit.

Table 7. Summary of the annual cost of alternative power and annual project cost for three alternatives for the Gorham Project (Source: staff).

	No Action	Applicant's Proposal	Staff Alternative
Installed capacity	2.15 MW	2.15 MW	2.15 MW
Annual generation	10,368 MWh	10,368 MWh	10,368 MWh
Capacity benefit[a]	1.7	1.7	1.7
Current alternative source of power's cost[b]	$1,044,919	$1,044,919	$1,044,919
Total annual project cost (2023)[c]	$844,565	$844,565	$847,009
Difference between the alternative source of power's cost and total annual project cost	$200,354	$200,354	$197,910

[a] Staff estimated the capacity benefit based on the ratio of the mean annual flow available for generation for each of 12 months, and the hydraulic capacity of the project. This ratio is multiplied by the authorized installed capacity to determine the capacity benefit.

[b] The value of power for the Gorham Project is based on the alternative source of power cost in the New England Region, as identified in table 6 above.

[c] Project costs include the cost of environmental measures listed in table 5 in Appendix C, and the costs identified in table 6. All project costs were adjusted to 2023 dollars.

COMPARISON OF ALTERNATIVES

Table 7 summarizes the installed capacity, annual generation, capacity benefit, alternative source of power's cost, estimated total project cost, and difference between the alternative source of power's cost and total project cost for each of the alternatives considered in this EA: no-action, the applicant's proposal, and the staff alternative.

No-Action Alternative

Under the No Action alternative, the project has an installed capacity of 2.15 MW, a capacity benefit of 1.7 MW, and an average annual generation of 10,368 MWh. The alternative source of power's current cost to produce the same amount of energy and provide the same capacity benefit is $1,044,919. The total annual project cost is $844,565. Subtracting the total annual project cost from the alternative source of power's current cost, the project's cost to produce power and capacity is $200,354 less than that of the alternative source of power's cost.

Applicant's Proposal

Under the applicant's proposal, the project would have a total installed capacity of 2.15 MW, a capacity benefit of 1.7 MW, and an average annual generation of 10,368 MWh. The alternative source of power's current cost to produce the same amount of energy and provide the same capacity benefit would be $1,044,919. The total annual project cost would be $844,565. Subtracting the total annual project cost from the alternative source of power's current cost, the project's cost to produce power and capacity would be $200,354 less than that of the alternative source of power's cost.

Staff Alternative

Under the applicant's proposal, the project would have a total installed capacity of 2.15 MW, a capacity benefit of 1.7 MW, and an average annual generation of 10,368 MWh. The alternative source of power's current cost to produce the same amount of energy and provide the same capacity benefit would be $1,044,919. The total annual project cost would be $847,009. Subtracting the total annual project cost from the alternative source of power's current cost, the project's cost to produce power and capacity would be $197,910 less than that of the alternative source of power's cost.

Cost of Environmental Measures

Table 5 in Appendix C presents the cost of each of the environmental enhancement measures considered in our analysis for the Gorham Project. All costs are in 2023 dollars. We convert all costs to equal annual (levelized) values over a 30-year period of analysis to give a uniform basis for comparing the benefits of a measure to its cost.

APPENDIX F- COMPREHENSIVE DEVELOPMENT

Additional Measures Recommended by Staff

Below, we discuss the basis for staff's recommended additions or modifications to CRP's proposal.

Time of Year Restrictions for Tree Removal

The NLEB may occur in the project area because project lands and adjacent areas support forests that may provide opportunities for summer roosting and foraging activities. Clearing vegetation for ongoing project maintenance activities and along the transmission line during the term of a new license could require unanticipated tree removal within the project boundary. To protect NLEB, FWS recommends state-specific dates that suggest avoiding tree removal in New Hampshire between April 15 and October 31. Under FWS's recommendation, it states that the time-of-year restriction would not apply under public safety or other emergencies, and in those instances, the applicant should notify FWS within two business days of the unplanned safety/emergency action and provide details of the action and response.

Because maintenance activities at the project during the term of a new license are expected to only require minor trimming, brush clearing, and the removal of downed trees, there is no information to suggest that relicensing would adversely affect NLEB maternity roost habitat. NLEB are not known to use trees less than 3 inches in diameter at breast height; therefore, there would be little benefit to NLEB by prohibiting the removal of trees 3 inches in diameter or less.

The tri-colored bat may also occur in the project area and may use similar hardwood habitats for summer roosting. Prohibiting the removal of trees 3 inches or greater or the trimming of trees between April 15 and October 31 would also protect the tri-colored bat.

Accordingly, we recommend that the license include a requirement that prohibits removal or trimming trees equal to or greater than 3 inches in diameter at breast height between April 15 and October 31, unless required for public or project safety. If trees are cut during this time period, we recommend that the licensee notify FWS within two business days of the unplanned safety/emergency action and provide details of the action and response. The costs to prohibit tree cutting between April 15 and October 31 should be negligeable or zero.

Historic Properties Management Plan

The project dam, powerhouse and other components are not eligible for listing on the National Register; therefore, continued operation and maintenance of the facilities would not result in an adverse effect. However, the project inundates the National-Register-eligible Eddy Bridge and Logging Boom sites. While there are no changes contemplated in project operation that would adversely affect these sites, future maintenance actions (e.g., repairs or modifications) could result in unanticipated adverse effects to the Eddy Bridge and Logging Boom sites.

To protect cultural resources, CRP proposes to continue to implement the July 29, 1996, CRMP for the term of the new license. The 1996 CRMP describes policies and procedures to assure internal communications about actions which have the potential to affect cultural resources, policies and procedures to assure communications with the SHPO and the Commission on any actions affecting cultural resources including newly discovered sites, and actions to ensure any newly discovered resources are recorded, documented and evaluated for National Register eligibility.

Because of the potential for unanticipated effects of project operation and maintenance on the Eddy Bridge and Logging Boom sites, an HPMP is needed to protect these sites and any other newly discovered resources.

The 1996 CRMP was developed as a requirement of the current license and does not conform to the current guidelines for the Historic Property Management Plans, as established by the Commission and the Advisory Council. For example, the CRMP identifies responsible entities for implementing the CRMP and consulting with the SHPO that are likely no longer present. Other issues include dated maps, consultation procedures, and survey information.

Therefore, we recommend that CRP file an HPMP for Commission approval within 1 year of issuance of any new license that includes the provisions in the current CRMP updated to conform to current standards for HPMPs as stipulated in the Commission's current guidelines for the development of Historic Properties Management Plans.[64] The plan should be developed in consultation with the New Hampshire SHPO and contain current contacts and procedures for consulting with the New Hampshire SHPO and dealing with newly discovered properties. Commission staff intend to execute a PA with the New Hampshire SHPO. The PA would describe the measures required in the HPMP. Commission staff intend to execute a PA with the New Hampshire SHPO. The PA would describe the measures required in the HPMP. We estimate that the annual levelized cost of developing and implementing an HPMP would be $2,444 and conclude that the benefits of an HPMP outweigh the cost.

[64] This document was issued jointly by the Commission and the Advisory Council on May 20, 2002. The document is available at: https://www.ferc.gov/sites/default/files/2020-04/DevelopmentofHistoricPropertiesManagementPlans.pdf

APPENDIX G- DRAFT LICENSE CONDITIONS RECOMMENDED BY STAFF

Draft Article 001. *Project Modification Resulting from Environmental Requirements*. If environmental requirements under this license require modification that may affect the project works or operations, the licensee must consult with the Division of Dam Safety and Inspections – Regional Engineer. Consultation must allow sufficient review time for the Commission to ensure that the proposed work does not adversely affect the project works, dam safety, or project operation.

Draft Article 002. *Project Operation*. The licensee must operate the project as follows:

(1) operate the project in a run-of-river mode by maintaining the impoundment within 2 inches of the headwater elevation of 772.53 feet NGVD 29 such that, at any point in time, the sum of all outflows from the project approximates the sum of all inflows to the project;

(2) provide a minimum flow of 200 cfs or inflow, whichever is less, to the project's bypassed reach.

Reporting of Planned Deviations

Run-of-river operation, impoundment level, and minimum flow requirements of this article may be temporarily modified for short periods, of up to 3 weeks, after mutual agreement among the licensee and the U.S. Fish and Wildlife Service and the New Hampshire Department of Environmental Services (collectively, resource agencies). After concurrence from the resource agencies, the licensee must file a report with the Secretary of the Commission as soon as possible, but no later than 14 days after the onset of the planned deviation. Each report must include: (1) the reasons for the deviation and how project operations were modified, (2) the duration and magnitude of the deviation, (3) any observed or reported environmental effects and how potential effects were evaluated, and (4) documentation of consultation with the resource agencies. For planned deviations exceeding 3 weeks, the licensee must file an application for a temporary amendment of the operational requirements and receive Commission approval prior to implementation.

Reporting of Unplanned Deviations

Run-of-river operation, impoundment level, and minimum flow requirements may be temporarily modified if required by operating emergencies beyond the control of the licensee (i.e., unplanned deviations). For any unplanned deviation from run-of-river operation or impoundment level and minimum flow requirements that lasts longer than 3 hours or results in visible environmental effects such as a fish kill, the licensee must notify the resource agencies within 24 hours and the Commission within 14 days, and file a report with the Commission as soon as possible, but no later than 30 days after each such incident. The report must include: (1) the cause of the deviation, (2) the duration and magnitude of the deviation, (3) any pertinent operational and/or monitoring data, (4) a timeline of the incident and the licensee's response, (5) any comments or correspondence received from the resource agencies, or confirmation that no

comments were received from the resource agencies, (6) documentation of any observed or reported environmental effects and how potential effects were evaluated, and (7) a description of measures implemented to prevent similar deviations in the future.

For unplanned deviations from run-of-river operation or impoundment level and minimum flow requirements lasting 3 hours or less that do not result in visible environmental effects, the licensee must file an annual report, by March 1, describing each incident that occurred during the prior January 1 through December 31 time period. The report must include for each 3 hours or less deviation: (1) the cause of the deviation, (2) the duration and magnitude of the deviation, (3) any pertinent operational and/or monitoring data, (4) a timeline of the incident and the licensee's response to each deviation, (5) any comments or correspondence received from the resource agencies, or confirmation that no comments were received from the resource agencies, and (6) a description of measures implemented to prevent similar deviations in the future.

Draft Article 003. *Operation Compliance Monitoring Plan*. Within six months of license issuance, the licensee must file, for Commission approval, an Operation Compliance Monitoring Plan. The Operation Compliance Monitoring Plan must include, at a minimum, the following:

(1) a detailed description of how the licensee will monitor and document compliance with the operational requirements of Draft Article 002

(2) a description of each gage or other measuring device that will be used to monitor compliance with Draft Article 002, including gage or measuring device location;

(3) a description of the procedures for maintaining and calibrating all monitoring equipment;

(4) standard operating procedures to be implemented outside of normal operating conditions, including during: (a) scheduled facility shutdowns and maintenance; and (b) emergency conditions such as unscheduled facility shutdowns and maintenance; and

(5) and implementation schedule.

The licensee must prepare the plan after consultation with the U.S. Fish and Wildlife Service and New Hampshire Department of Environmental Services (collectively, resource agencies). The licensee must include with the plan documentation of consultation, copies of comments and recommendations on the completed plan after it has been prepared and provided to the resource agencies, and specific descriptions of how the resource agencies' comments are accommodated by the plan. The licensee must allow a minimum of 30 days for the resource agencies to comment and to make recommendations before filing the plan with the Commission. If the licensee does not adopt a recommendation, the filing must include the licensee's reasons, based on project-specific information.

The Commission reserves the right to require changes to the plan. The licensee must not begin implementing the plan until the Commission notifies the licensee that the plan is approved. Upon Commission approval the licensee must implement the plan, including any changes required by the Commission.

Draft Article 004. *Reservation of Authority to Prescribe Fishways*. Authority is reserved to the Commission to require the licensee to construct, operate, and maintain fishways as may be prescribed by the Secretary of the Interior pursuant to section 18 of the Federal Power Act.

Draft Article 005. *Northern Long-Eared Bat and Tricolored Bat Protection.* The licensee must not remove or trim trees on project lands equal to or greater than 3 inches diameter at breast height from April 15 to October 31 to protect northern long-eared bats and tricolored bats. Tree removal and trimming during this period is not prohibited to ensure public or project safety (e.g., removing dead fall trees). If trees are removed during this period on an emergency basis, the licensee must notify the U.S. Fish and Wildlife Service within two business days of the unplanned safety/emergency action and provide details of the action and response.

Draft Article 006. *Programmatic Agreement and Historic Properties Management Plan*. The licensee must implement the "Programmatic Agreement Between the Federal Energy Regulatory Commission and the New Hampshire State Historic Preservation Officer for Managing Historic Properties that May be Affected by Issuance of a License to Central Rivers Power, NH LLC (CRP) for the Continued Operation of the Gorham Hydroelectric Project in Coos County, New Hampshire FERC No. P-2288-057," executed on (*date*), and including, but not limited to, the approved Historic Properties Management Plan (HPMP) for the project. In the event that the Programmatic Agreement is terminated, the licensee must continue to implement the provisions of its approved HPMP.

The Commission reserves the authority to require changes to the HPMP at any time during the term of the license. If the programmatic agreement is terminated prior to the Commission approval of HPMP, the licensee must obtain approval from the Commission and the New Hampshire SHPO before engaging in any ground-disturbing activities or taking any other action that may affect any historic properties within the project's area of potential effects.

Draft Article 007. *Recreation Facilities*. The licensee must operate and maintain the following recreation facilities for the term of the license: (1) canoe portage take-out and put-in, portage path, and picnic table along the path; (2) informational kiosk located on the north shore of the impoundment containing maps and other recreation information; (3) informational signage located at the Route 2 entrance to the project and on Hogan Road; and (4) the approximately 20-foot by 60-foot gravel parking area located off Route 2 that contains space for six vehicles and one designated parking space for the disabled.

Draft Article 008. *Use and Occupancy*. (a) In accordance with the provisions of this article, the licensee must have the authority to grant permission for certain types of use and occupancy of project lands and waters and to convey certain interests in project lands and waters for certain types of use and occupancy, without prior Commission approval. The licensee may exercise the authority only if the proposed use and occupancy is consistent with the purposes of

protecting and enhancing the scenic, recreational, and other environmental values of the project. For those purposes, the licensee must also have continuing responsibility to supervise and control the use and occupancies for which it grants permission, and to monitor the use of, and ensure compliance with the covenants of the instrument of conveyance for, any interests that it has conveyed, under this article. If a permitted use and occupancy violates any condition of this article or any other condition imposed by the licensee for protection and enhancement of the project's scenic, recreational, or other environmental values, or if a covenant of a conveyance made under the authority of this article is violated, the licensee must take any lawful action necessary to correct the violation. For a permitted use or occupancy, that action includes, if necessary, canceling the permission to use and occupy the project lands and waters and requiring the removal of any non-complying structures and facilities.

(b) The type of use and occupancy of project lands and waters for which the licensee may grant permission without prior Commission approval are: (1) landscape plantings; (2) non-commercial piers, landings, boat docks, or similar structures and facilities that can accommodate no more than 10 water craft at a time and where said facility is intended to serve single-family type dwellings; (3) embankments, bulkheads, retaining walls, or similar structures for erosion control to protect the existing shoreline; and (4) food plots and other wildlife enhancement. To the extent feasible and desirable to protect and enhance the project's scenic, recreational, and other environmental values, the licensee must require multiple use and occupancy of facilities for access to project lands or waters. The licensee must also ensure that, to the satisfaction of the Commission's authorized representative, the use and occupancies for which it grants permission are maintained in good repair and comply with applicable state and local health and safety requirements. Before granting permission for construction of bulkheads or retaining walls, the licensee must: (1) inspect the site of the proposed construction, (2) consider whether the planting of vegetation or the use of riprap would be adequate to control erosion at the site, and (3) determine that the proposed construction is needed and would not change the basic contour of the impoundment shoreline. To implement this paragraph (b), the licensee may, among other things, establish a program for issuing permits for the specified types of use and occupancy of project lands and waters, which may be subject to the payment of a reasonable fee to cover the licensee's costs of administering the permit program. The Commission reserves the right to require the licensee to file a description of its standards, guidelines, and procedures for implementing this paragraph (b) and to require modification of those standards, guidelines, or procedures.

(c) The licensee may convey easements or rights-of-way across, or leases of project lands for: (1) replacement, expansion, realignment, or maintenance of bridges or roads where all necessary state and federal approvals have been obtained; (2) storm drains and water mains; (3) sewers that do not discharge into project waters; (4) minor access roads; (5) telephone, gas, and electric utility distribution lines; (6) non-project overhead electric transmission lines that do not require erection of support structures within the project boundary; (7) submarine, overhead, or underground major telephone distribution cables or major electric distribution lines (69-kilovolts or less); and (8) water intake or pumping facilities that do not extract more than one million gallons per day from a project impoundment. No later than January 31 of each year, the licensee must file with the Commission a copy of a report briefly describing for each conveyance made under this paragraph (c) during the prior calendar year, the type of interest conveyed, the location

of the lands subject to the conveyance, and the nature of the use for which the interest was conveyed. No report filing is required if no conveyances were made under paragraph (c) during the previous calendar year.

(d) The licensee may convey fee title to, easements or rights-of-way across, or leases of project lands for: (1) construction of new bridges or roads for which all necessary state and federal approvals have been obtained; (2) sewer or effluent lines that discharge into project waters, for which all necessary federal and state water quality certification or permits have been obtained; (3) other pipelines that cross project lands or waters but do not discharge into project waters; (4) non-project overhead electric transmission lines that require erection of support structures within the project boundary, for which all necessary federal and state approvals have been obtained; (5) private or public marinas that can accommodate no more than 10 water craft at a time and are located at least one-half mile (measured over project waters) from any other private or public marina; (6) recreational development consistent with an approved report on recreational resources of an Exhibit E; and (7) other uses, if: (i) the amount of land conveyed for a particular use is five acres or less; (ii) all of the land conveyed is located at least 75 feet, measured horizontally, from project waters at normal surface elevation; and (iii) no more than 50 total acres of project lands for each project development are conveyed under this clause (d)(7) in any calendar year. At least 60 days before conveying any interest in project lands under this paragraph (d), the licensee must file a letter with the Commission, stating its intent to convey the interest and briefly describing the type of interest and location of the lands to be conveyed (a marked Exhibit G map may be used), the nature of the proposed use, the identity of any federal or state agency official consulted, and any federal or state approvals required for the proposed use. Unless the Commission's authorized representative, within 45 days from the filing date, requires the licensee to file an application for prior approval, the licensee may convey the intended interest at the end of that period.

(e) The following additional conditions apply to any intended conveyance under paragraph (c) or (d) of this article:

(1) Before conveying the interest, the licensee must consult with federal and state fish and wildlife or recreation agencies, as appropriate, and the State Historic Preservation Officer.

(2) Before conveying the interest, the licensee must determine that the proposed use of the lands to be conveyed is not inconsistent with any approved report on recreational resources of an Exhibit E; or, if the project does not have an approved report on recreational resources, that the lands to be conveyed do not have recreational value.

(3) The instrument of conveyance must include the following covenants running with the land: (i) the use of the lands conveyed must not endanger health, create a nuisance, or otherwise be incompatible with overall project recreational use; (ii) the grantee must take all reasonable precautions to ensure that the construction, operation, and maintenance of structures or facilities on the conveyed lands will occur in a manner that will protect the scenic, recreational, and environmental values of the project; and (iii) the grantee must not unduly restrict public access to project lands and waters.

(4) The Commission reserves the right to require the licensee to take reasonable remedial action to correct any violation of the terms and conditions of this article, for the protection and enhancement of the project's scenic, recreational, and other environmental values.

(f) The conveyance of an interest in project lands under this article does not in itself change the project boundaries. The project boundaries may be changed to exclude land conveyed under this article only upon approval of revised Exhibit G drawings (project boundary maps) reflecting exclusion of that land. Lands conveyed under this article will be excluded from the project only upon a determination that the lands are not necessary for project purposes, such as operation and maintenance, flowage, recreation, public access, protection of environmental resources, and shoreline control, including shoreline aesthetic values. Absent extraordinary circumstances, proposals to exclude lands conveyed under this article from the project must be consolidated for consideration when revised Exhibit G drawings would be filed for approval for other purposes.

(g) The authority granted to the licensee under this article must not apply to any part of the public lands and reservations of the United States included within the project boundary.

Maryam Zavareh – Geologic and Soil Resources, Developmental Analysis (Civil and Environmental Engineer; Ph.D. Civil and Environmental Engineering)

APPENDIX K- STAFF RESPONSE TO COMMENTS ON DRAFT ENVIRONMENTAL ASSESSMENT

Commission staff issued its draft environmental assessment (DEA) for the relicensing of the Gorham Hydroelectric Project on April 5, 2024. Staff requested comments on the DEA to be filed by May 6, 2024. The following entities filed comments pertaining to the DEA.

Commenting Entity	**Date Filed**
CRP	May 3. 2024
City of Berlin and Town of Gorham	May 7. 2024

Below, we summarize the comments that pertain to our analysis; respond to those comments; and indicate, where appropriate, how we modified the EA. The comments are grouped by topic for convenience. We do not summarize and respond to comments that request legal determinations and associated authorizations, only express general opinions either for or against the proposed project or the staff alternative, or simply reiterate a stakeholder's position or recommendation.

Comment: The City of Berlin and the Town of Gorham (the Municipalities) request that Commission staff assess the adequacy of the proposed project boundary and review CRP's flowage easements associated with the Gorham Project, particularly with regard to the extent that those easements are necessary to comply with any license issued for the project.

Response: Standard Article 5 of the current license requires the licensee to acquire and retain title in fee to, or the right to use in perpetuity, project property sufficient to accomplish all project purposes (*e.g.*, flowage easements). The Gorham project operates in a run-of-river mode by maintaining the impoundment level within 2 inches of the headwater elevation of 772.53 feet such that at any given point time, all outflows from the project approximate all inflows. Commission staff reviewed the proposed project boundary in CRP's Exhibit G drawing included with the license application and note that it encloses all project facilities (reservoir, powerhouse, and penstock), and that the project boundary at the reservoir does not extend past the contour elevation of 772.53 feet consistent with the current operation limits. Therefore, Commission staff makes no recommendation for revisions to the proposed project boundary. The extent to which CRP holds easements beyond the project boundary is a legal matter beyond the scope of the EA.

Comment: The Municipalities state that the Emergency Action Plan (EAP) for the project, or in the alternative the Operations Compliance Monitoring Plan, needs to include certain provisions to address flooding events at the project and potential adverse effects, such as the intrusion of fresh water into the Town of Gorham's sewage treatment system, which would result in raw sewage entering the Androscoggin River. The recommended provisions include monitoring snowpack in the upper basin and area weather stations, and stationing operations

personnel close to the project during anticipated flood events to respond quickly to needed operational changes to prevent flooding and overtopping of the dam,

Response: Flood events like those described by the Municipalities are addressed through the project's EAP rather than the Operations Compliance Monitoring Plan. The purpose of an operations compliance monitoring plan is to document the procedures a licensee will implement in order to ensure that they comply with the operational requirements of the license. Generally, its purpose is not to direct flood control procedures.

Section 12.20 (a) of the Commission's regulations requires every licensee to develop and file an EAP with the Commission's Regional Engineer unless granted a written exemption in accordance with Section 12.21 (a) of the regulations. An EAP is a formal document that identifies potential emergency conditions at a dam and specifies preplanned actions to be followed to minimize property damage and loss of life. The project's current EAP (April 2023) describes actions that the licensee will take to moderate or alleviate a problem at the dam, as well as what actions the licensee, in coordination with emergency management authorities, should take to respond to incidents or emergencies related to the dam. It presents procedures and information to assist the licensee in issuing early warning and notification messages to responsible downstream emergency management authorities. The EAP also contains inundation maps to assist the licensee and emergency management authorities by identifying critical infrastructure and population-at-risk sites that may require protective measures, warning and evacuation planning. The EAP clearly defines the responsibilities of all those involved in managing the incident and how those responsibilities should be coordinated including in the event of a flood that affects the Town of Gorham's sewage treatment system. EAPs are periodically updated and reviewed by Commission staff throughout the term of the license to ensure the continued protection of the public and critical infrastructure.

Comment: The Municipalities state that Commission staff did not consider alternative recreational opportunities to benefit the public at the project.

Response: Commission staff analyzed the usage, condition, and satisfaction of recreation at the project in section 3.3.4., *Recreation Resources*, and concluded that the project recreation facilities meet current and future demand at the project. No specific recommendations or comments regarding the need for additional recreational resources at the project were filed in response to the REA notice. Therefore, no additional measures were considered in the EA.

Comment: The Municipalities request that recreation be an ongoing collaboration with the Municipalities to address future issues as they may arise, as public use has increased due to recent improvements.

Response: Commission staff noted in section 3.3.4., *Recreation Resources*, that recreation resources at the project, including staff's recommended enhancements, would meet current and projected demand. Should there be a future need for additional recreation facilities or amenities to support increased use at the project, the Municipalities could notify CRP who could then seek Commission approval for additional project recreation facilities.
